#### About the Project

- individual (Bc students and complex assignments in pairs)
- implementation of two/more graph algorithms, experiments, comparison
- own assignment (suggestion of algorithms related to your thesis)
- presentation of your solutions during the last lecture
- implementation programming language C/C++, Java, Python, Ruby (anything available at Merlin server or agreed by the teacher)

### Algorithms and Complexity

#### **Basic Notions**

- Informally, algorithm is a well-defined procedure (sequence of computational steps) that transforms some input into the corresponding output.
- Data structure is a way of storage and organization of data optimized for access and/or modification.

#### Requirements on Algorithms

- Finiteness: Algorithm always ends for a valid (correct) input.
- Soundness, Correctness: The result is correct as well.
- Memory and time are limited!
- There is many solutions, we focus on the effective ones.

#### Algorithm Complexity

Time complexity of algorithm:

Running time T(n) – function giving the maximum number of "primitive" steps depending on the size of an input n, i.e. number of steps in the worst case.

Space complexity of algorithm:

Memory consumption S(n) – function giving the maximum number of used memory cells during the computation depending on the size of an input n. (including algorithm initialization or not?)

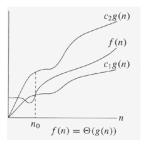

In general, n can be a vector (multidimensional).

#### $\Theta$ -notation

- Let g(n) be a function. Let f(n) denote, for instance, T(n) or S(n).
  - $\Theta(g(n)) = \{f(n): \text{ there exist } c_1, c_2, n_0 > 0 \text{ such that } \}$

 $0 \le c_1 g(n) \le f(n) \le c_2 g(n) \text{ for all } n \ge n_0 \}.$ 

- $\Theta(g(n))$  is a family of functions that can be "sandwiched" between  $c_1g(n)$  and  $c_2g(n)$ , for sufficiently large n.
- ► Sometimes written as  $f(n) = \Theta(g(n))$  instead  $f(n) \in \Theta(g(n))$ .
- We say that g(n) is an asymptotically tight bound for f(n).

•  $\frac{1}{2}n^2 - 3n = \Theta(n^2)$  - verify its properties for  $c_1 = \frac{1}{14}, c_2 = \frac{1}{2}, n_0 = 7.$ 

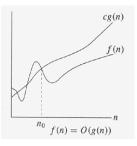

Figure: Θ-notation.

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ ののの

#### O-notation

Let g(n) be a function.

- $O(g(n)) = \{f(n) : \text{ there exist } c, n_0 > 0 \text{ such that}$  $0 \le f(n) \le cg(n) \text{ for all } n \ge n_0\}.$
- O(g(n)) is a family of functions f(n) such that f(n)'s value is on or below cg(n) for all  $n \ge n_0$ .
- f(n) = O(g(n)) means some cg(n) is an asymptotic upper bound on f(n) (but not necessarily tight  $\approx$  worst-case scenario).

$$\Theta(g(n)) \subseteq O(g(n)).$$
*n* = O(n<sup>2</sup>), but *n* ≠ Θ(n<sup>2</sup>).

Figure: O-notation.

イロト 不得 トイラト イラト 一日

#### $\Omega$ -notation

Let g(n) be a function.

- $\Omega(g(n)) = \{f(n) : \text{ there exist } c, n_0 > 0 \text{ such that} \\ 0 \le cg(n) \le f(n) \text{ for all } n \ge n_0\}.$
- Ω(g(n)) is a family of functions f(n) such that f(n)'s value is on or above cg(n) for all n ≥ n<sub>0</sub>.
- $f(n) = \Omega(g(n))$  means some cg(n) is an asymptotic lower bound on f(n) (but not necessarily tight  $\approx$  best-case scenario).

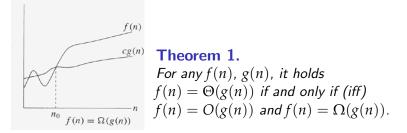

Figure:  $\Omega$ -notation.

Let g(n) be a function.

•  $o(g(n)) = \{f(n) : \text{ for every } c > 0 \text{ there exist } n_0 > 0 \text{ such that}$  $0 \le f(n) < cg(n) \text{ for all } n \ge n_0\}.$ 

upper bound that is NOT asymptotically tight

Let g(n) be a function.

•  $o(g(n)) = \{f(n) : \text{ for every } c > 0 \text{ there exist } n_0 > 0 \text{ such that}$  $0 \le f(n) < cg(n) \text{ for all } n \ge n_0\}.$ 

upper bound that is NOT asymptotically tight

•  $\omega(g(n)) = \{f(n) : \text{ for every } c > 0 \text{ there exist } n_0 > 0 \text{ such that } 0 \le cg(n) < f(n) \text{ for all } n \ge n_0\}.$ 

Iower bound that is NOT asymptotically tight

Let g(n) be a function.

•  $o(g(n)) = \{f(n) : \text{ for every } c > 0 \text{ there exist } n_0 > 0 \text{ such that}$  $0 \le f(n) < cg(n) \text{ for all } n \ge n_0\}.$ 

upper bound that is NOT asymptotically tight

- $\omega(g(n)) = \{f(n) : \text{ for every } c > 0 \text{ there exist } n_0 > 0 \text{ such that } 0 \le cg(n) < f(n) \text{ for all } n \ge n_0\}.$ 
  - Iower bound that is NOT asymptotically tight
- ►  $f(n) \in \omega(g(n))$  iff  $g(n) \in o(f(n))$ .

Let g(n) be a function.

• 
$$o(g(n)) = \{f(n) : \text{ for every } c > 0 \text{ there exist } n_0 > 0 \text{ such that} \\ 0 \le f(n) < cg(n) \text{ for all } n \ge n_0\}.$$

upper bound that is NOT asymptotically tight

• 
$$\omega(g(n)) = \{f(n) : \text{ for every } c > 0 \text{ there exist } n_0 > 0 \text{ such that} \\ 0 \le cg(n) < f(n) \text{ for all } n \ge n_0\}.$$

Iower bound that is NOT asymptotically tight

• 
$$f(n) \in \omega(g(n))$$
 iff  $g(n) \in o(f(n))$ .

Let g(n) be a function.

•  $o(g(n)) = \{f(n) : \text{ for every } c > 0 \text{ there exist } n_0 > 0 \text{ such that } 0 \le f(n) < cg(n) \text{ for all } n \ge n_0\}.$ 

upper bound that is NOT asymptotically tight

- $\omega(g(n)) = \{f(n) : \text{ for every } c > 0 \text{ there exist } n_0 > 0 \text{ such that } 0 \le cg(n) < f(n) \text{ for all } n \ge n_0\}.$ 
  - Iower bound that is NOT asymptotically tight
- $f(n) \in \omega(g(n))$  iff  $g(n) \in o(f(n))$ .
- 2n = o(n<sup>2</sup>), but 2n<sup>2</sup> ≠ o(n<sup>2</sup>).
   f(n) = o(g(n)), if lim<sub>n→∞</sub> f(n)/g(n) = 0.
- n<sup>2</sup>/2 = ω(n), but n<sup>2</sup>/2 ≠ ω(n<sup>2</sup>).
   f(n) = ω(g(n)), if

$$\lim_{n\to\infty}\frac{f(n)}{g(n)}=\infty.$$

Figure: Map of bridges and its logical representation.

Directed graph (digraph) G is a pair

 $G=\left( V,E\right) ,$ 

where

- ▶ *V* is a finite set of vertices (nodes) and
- $E \subseteq V^2$  is a set of edges (arrows, arcs).

An edge (u, u) is called a self-loop. If (u, v) is an edge, we say that (u, v) is incident from u and incident to v, that is v is adjacent to u.

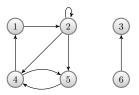

Figure: Digraph

イロト イボト イヨト イヨト

A graph G' = (V', E') is a subgraph of G = (V, E), if  $\lor V' \subseteq V$  and  $E' \subseteq E$ .

Let  $V'' \subseteq V$ . Subgraph induced by V'' is graph G'' = (V'', E''), where  $\blacktriangleright E'' = \{(u, v) \in E : u, v \in V''\}.$ 

Let  $E''' \subseteq E$ . Factor subgraph of G is graph G''' = (V, E''').

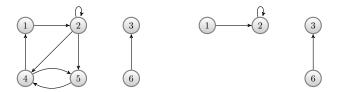

Figure: A graph and its subgraph induced by  $\{1, 2, 3, 6\}$ .

18 / 252

#### Undirected graph G is a pair

$$G=\left( V,E\right) ,$$

where

- V is a finite set of vertices and
- $E \subseteq \binom{V}{2}$  is a set of edges.

#### Note

An edge is a set  $\{u, v\}$ , where  $u, v \in V$  and  $u \neq v$ . Self-loops are forbidden.

Convention:  $\{u, v\}$ , (u, v), and (v, u) denote the same edge.

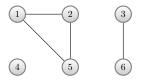

Figure: Undirected Graph

イロト 不得 トイラト イラト 一日

Degree of vertex u in an undirected graph is the number of adjacent vertices, denoted by d(u).

► 
$$d(1) = d(2) = d(5) = 2$$
,  $d(3) = d(6) = 1$ ,  $d(4) = 0$ .

▶ If d(u) = 0, u is called isolated vertex.

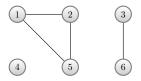

Figure: Undirected graph

- Out-degree of vertex u is the number of outcoming edges, denoted as deg\_(u).
- In-degree of vertex u is the number of incoming edges, denoted as deg<sub>+</sub>(u).
- Degree of vertex u is the sum of its in-degree and out-degree, denoted as deg(u).
- $deg_{-}(2) = 3$ ,  $deg_{+}(2) = 2$ , deg(2) = 5.

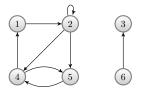

Figure: Digraph

- A path is tour if all edges in the path are distinct.
- A path is simple if all vertices in the path are distinct.

- Give some examples of a path and simple path.
- Give an example of unconnected sequence.

A subpath s of  $p = \langle v_0, v_1, v_2, \dots, v_k \rangle$  is a contiguous subsequence,  $s = \langle v_i, v_{i+1}, v_{i+2}, \dots, v_j \rangle$ , for  $0 \le i \le j \le k$ .

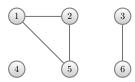

- A subpath s of  $p = \langle v_0, v_1, v_2, \dots, v_k \rangle$  is a contiguous subsequence,  $s = \langle v_i, v_{i+1}, v_{i+2}, \dots, v_j \rangle$ , for  $0 \le i \le j \le k$ .
- ▶ A path  $c = \langle v_0, v_1, v_2, ..., v_k \rangle$  is a cycle (closed path), if  $k \ge 1$  and  $v_0 = v_k$ .
- For undirected graph, let  $k \geq 3$ .

- A subpath s of  $p = \langle v_0, v_1, v_2, \dots, v_k \rangle$  is a contiguous subsequence,  $s = \langle v_i, v_{i+1}, v_{i+2}, \dots, v_j \rangle$ , for  $0 \le i \le j \le k$ .
- A path  $c = \langle v_0, v_1, v_2, \dots, v_k \rangle$  is a cycle (closed path), if  $k \ge 1$  and  $v_0 = v_k$ .
- For undirected graph, let  $k \geq 3$ .
- Closed simple path is called simple cycle.

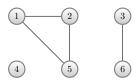

- What is (1, 2, 4, 5, 4, 1)?
- ► What is (1,2,4,1)?
- What is  $\langle 2,2\rangle$ ?

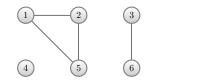

23 / 252

\$\langle 1, 2, 5, 1 \rangle\$ is an undirected cycle.
\$\langle 3, 6, 3 \rangle\$ is not a cycle

<1,2,5,1 is an undirected cycle.</p>
<3,6,3 is not a cycle , or is it?</p>

<1,2,5,1 is an undirected cycle.</p>
<3,6,3 is not a cycle , or is it?</p>

- A digraph with no self-loops is simple.
- Acyclic graph contains no cycles.

Let G = (V, E) be a graph with *n* vertices.

▶ Isolated graph  $\Phi_n$ :  $E = \emptyset$ . (Null graph if even  $V = \emptyset$ .)

Let G = (V, E) be a graph with n vertices.

- ▶ Isolated graph  $\Phi_n$ :  $E = \emptyset$ . (Null graph if even  $V = \emptyset$ .)
- Complete graph  $K_n$ :  $E = \binom{V}{2}$ .

Let G = (V, E) be a graph with n vertices.

- ▶ Isolated graph  $\Phi_n$ :  $E = \emptyset$ . (Null graph if even  $V = \emptyset$ .)
- Complete graph  $K_n$ :  $E = \binom{V}{2}$ .
- ▶ Regular graph: For every  $u, v \in V$ , d(u) = d(v).

Let G = (V, E) be a graph with n vertices.

- ▶ Isolated graph  $\Phi_n$ :  $E = \emptyset$ . (Null graph if even  $V = \emptyset$ .)
- Complete graph  $K_n$ :  $E = \binom{V}{2}$ .
- ▶ Regular graph: For every  $u, v \in V$ , d(u) = d(v).
- Cycle graph:  $n \ge 3$  and vertices are connected in a closed chain.

#### Tree, Forest

- An undirected graph is connected if every pair of vertices is connected by a path.
- An connected, acyclic, undirected graph is a tree.

• Homework: Prove that |E| = |V| - 1.

- In a rooted tree, there is one special vertex called root (with no parents).
- An acyclic, undirected graph is a forest (several trees).

## Bipartite Graph

- Let G = (V, E) be a undirected graph.
- We call G bipartite if the vertex set V can be partitioned into V = L ∪ R,

where L and R are disjoint and all edges in E go between L and R.

L and R are called parts (disjoint and independent sets).

## Bipartite Graph

- Let G = (V, E) be a undirected graph.
- We call G bipartite if the vertex set V can be partitioned into V = L ∪ R,

where L and R are disjoint and all edges in E go between L and R.

- L and R are called parts (disjoint and independent sets).
- Optional additional condition:

Every vertex in V has at least one incident edge.

#### Bipartite Graph

- Let G = (V, E) be a undirected graph.
- We call G bipartite if the vertex set V can be partitioned into V = L ∪ R,

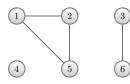

where L and R are disjoint and all edges in E go between L and R.

- L and R are called parts (disjoint and independent sets).
- Optional additional condition:
   Every vertex in V has at least one incident edge.
- Complete bipartite graph  $K_{m,n}$ : |L| = m, |R| = n, and |E| = mn.

Undirected graph is called connected, if there is a path between each pair of vertices.

- Undirected graph is called connected, if there is a path between each pair of vertices.
- Connected components of an undirected graph correspond to the equivalence classes by relation "is reachable from".

- Undirected graph is called connected, if there is a path between each pair of vertices.
- Connected components of an undirected graph correspond to the equivalence classes by relation "is reachable from".

A graph with three connected components:

イロト イボト イヨト イヨト

28 / 252

Digraph is strongly connected, if there exists a path between each pair of vertices.

- Digraph is strongly connected, if there exists a path between each pair of vertices.
- Strongly connected components of graph are the equivalence classes of vertices according to the relation "mutually reachable".

- Digraph is strongly connected, if there exists a path between each pair of vertices.
- Strongly connected components of graph are the equivalence classes of vertices according to the relation "mutually reachable".

Graph has three strongly connected components:

# Graph Representation

<ロト < 合 ト < 言 ト < 言 ト ミ の < で 30 / 252 Let G = (V, E) be a graph. Denote:

- $\blacktriangleright$  n = |V|
- $\blacktriangleright m = |E|.$
- 1. Adjacency-list representation
  - effective for sparse graphs  $(m \ll n^2)$ ;
  - we will use this representation in this talk.

Let G = (V, E) be a graph. Denote:

$$\blacktriangleright n = |V|$$

 $\blacktriangleright m = |E|.$ 

#### 1. Adjacency-list representation

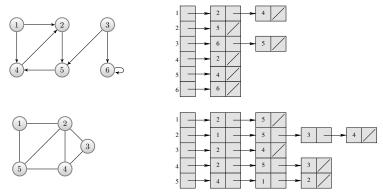

- effective for sparse graphs  $(m \ll n^2)$ ;
- we will use this representation in this talk.

#### 2. Adjacency-matrix representation

- effective for dense graphs (m close to n<sup>2</sup>);
- when we often need quick answer whether two given vertices are connected by an edge.

## Adjacency-list representation

- G = (V, E) is represented as
  - ▶ an array Adj[1...n] with n lists, one list for each vertex,
  - where Adj[u] stores all vertices v such that  $(u, v) \in E$ .

Space complexity:  $\Theta(m+n)$  (depends linearly on the size of the graph).

## Weighted graph

A weighted graph is a (di)graph where there is a value assigned to every edge using weight function w : E → ℝ.

## Weighted graph

- A weighted graph is a (di)graph where there is a value assigned to every edge using weight function w : E → ℝ.
- Representation of w(u, v) in adjacency list: extend the list item (a structure) for v in Adj[u] with value w(u, v).

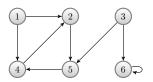

## Weighted graph

- A weighted graph is a (di)graph where there is a value assigned to every edge using weight function w : E → ℝ.
- Representation of w(u, v) in adjacency list: extend the list item (a structure) for v in Adj[u] with value w(u, v).
- Disadvantage: Finding whether an edge (u, v) belongs to E requires the search of the whole list Adj[u].

#### Adjacency-matrix representation

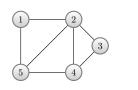

Let G = (V, E) be a graph and assume  $V = \{1, 2, ..., n\}$ . Adjacency matrix  $A = (a_{ij})$  is a matrix of size  $n \times n$  such that

$$a_{ij} = \begin{cases} 1 & \text{if } (i,j) \in E, \\ 0 & \text{otherwise.} \end{cases}$$

- Let G = (V, E) be a weighted graph, then

$$a_{ij} = \begin{cases} w(i,j) & \text{if } (i,j) \in E, \\ \text{NIL} & \text{otherwise,} \end{cases}$$

where NIL is a special value, mostly 0 or  $\infty$ .

#### Exercises

- 1. Given an adjacency-list representation of a directed graph and a vertex v, how long does it take to compute  $deg_{-}(v)$  and  $deg_{+}(v)$ ?
- 2. The transpose of a directed graph G = (V, E) is the graph  $G^T = (V, E^T)$ , where  $E^T = \{(v, u) \in V \times V : (u, v) \in E\}$ . Thus,  $G^T$  is G with all its edges reversed. Describe an efficient algorithm for computing  $G^T$  from G for the adjacency-list representation of G. Analyze the time complexity of your algorithm.
- 3. The square of a directed graph G = (V, E) is the graph  $G^2 = (V, E^2)$  such that  $(u, v) \in E^2$  if and only G contains a path with at most two edges between u and v. Describe an efficient algorithm for computing  $G^2$  from G for the adjacency-list representation of G. Analyze the time complexity of your algorithm.

- ▶ The overhead for initialization is O(n), so the total running time of BFS is O(m+n). Thus, it is linear in the size of G (adjacency-list representation).

▶ BFS finds the distance to each reachable vertex in G from a given source vertex s ∈ V. (No weight function yet)

### Shortest paths

- ▶ BFS finds the distance to each reachable vertex in G from a given source vertex s ∈ V. (No weight function yet)
- Define the shortest-path distance δ(s, v) from s to v as the minimum number of edges in any path from s to v. If there is no path from s to v, then δ(s, v) = ∞.

### Shortest paths

- ▶ BFS finds the distance to each reachable vertex in G from a given source vertex s ∈ V. (No weight function yet)
- Define the shortest-path distance δ(s, v) from s to v as the minimum number of edges in any path from s to v. If there is no path from s to v, then δ(s, v) = ∞.
- A path of length δ(s, v) from s to v is called a shortest path from s to v.

# **Lemma 2.** Let G = (V, E) be a (di)graph and $s \in V$ be a vertex. Then, for every edge $(u, v) \in E$ , $\delta(s, v) < \delta(s, u) + 1$ .

Proof.

If vertex u is reachable from s, then vertex v is reachable from s as well. Therefore, the shortest path from s to v is no longer than a shortest path from s to u followed by edge (u, v). So inequality holds.

# **Lemma 2.** Let G = (V, E) be a (di)graph and $s \in V$ be a vertex. Then, for every edge $(u, v) \in E$ ,

 $\delta(s,v) \leq \delta(s,u) + 1.$ 

Proof.

- If vertex u is reachable from s, then vertex v is reachable from s as well. Therefore, the shortest path from s to v is no longer than a shortest path from s to u followed by edge (u, v). So inequality holds.
- If vertex u is not reachable from s, then δ(s, u) = ∞ and, again, the inequality holds.

#### Lemma 3.

Let G = (V, E) be a (di)graph and assume that BFS is executed on G from vertex  $s \in V$ . Then, when BFS finishes, then  $d[v] \ge \delta(s, v)$  for every  $v \in V$ .

Proof.

▶ By induction on the number of ENQUEUE operations. Induction Hypothesis (IH): Assume that  $d[v] \ge \delta(s, v)$  for every  $v \in V$ .

45 / 252

#### Lemma 3.

Let G = (V, E) be a (di)graph and assume that BFS is executed on G from vertex  $s \in V$ . Then, when BFS finishes, then  $d[v] \ge \delta(s, v)$  for every  $v \in V$ .

Proof.

- ▶ By induction on the number of ENQUEUE operations. Induction Hypothesis (IH): Assume that  $d[v] \ge \delta(s, v)$  for every  $v \in V$ .
- Induction Basis (IB):  $d[s] = 0 = \delta(s, s)$  and  $d[v] = \infty \ge \delta(s, v)$ ,  $v \in V \{s\}$ .

45 / 252

#### Lemma 3.

Let G = (V, E) be a (di)graph and assume that BFS is executed on G from vertex  $s \in V$ . Then, when BFS finishes, then  $d[v] \ge \delta(s, v)$  for every  $v \in V$ .

Proof.

- ▶ By induction on the number of ENQUEUE operations. Induction Hypothesis (IH): Assume that  $d[v] \ge \delta(s, v)$  for every  $v \in V$ .
- Induction Basis (IB):  $d[s] = 0 = \delta(s, s)$  and  $d[v] = \infty \ge \delta(s, v)$ ,  $v \in V \{s\}$ .
- ► Let v is WHITE vertex discovered during the exploration from u. By IH, we have  $d[u] \ge \delta(s, u)$ . By line 15 of BFS, IH, and the previous lemma,

$$d[v] = d[u] + 1 \ge \delta(s, u) + 1 \ge \delta(s, v) \,.$$

Since v is GREY now (and enqueued) and lines 14–17 are executed only for WHITE vertices, v cannot be enqueued again and its d[v]value remains unchanged.

#### Lemma 4.

During the execution of BFS on G = (V, E), let queue Q contains vertices  $\langle v_1, v_2, \ldots, v_r \rangle$ , where  $v_1$  is the front item of Q (leader) and  $v_r$  is the last item of Q. Then,  $d[v_r] \leq d[v_1] + 1$  and  $d[v_i] \leq d[v_{i+1}]$  for  $i = 1, 2, \ldots, r - 1$ .

Proof.

▶ By induction on the number of queue operations. First, Q = ⟨s⟩, so lemma holds. It holds after execution of both queue operations:

#### Lemma 4.

During the execution of BFS on G = (V, E), let queue Q contains vertices  $\langle v_1, v_2, \ldots, v_r \rangle$ , where  $v_1$  is the front item of Q (leader) and  $v_r$  is the last item of Q. Then,  $d[v_r] \leq d[v_1] + 1$  and  $d[v_i] \leq d[v_{i+1}]$  for  $i = 1, 2, \ldots, r - 1$ .

### Proof.

- ▶ By induction on the number of queue operations. First,  $Q = \langle s \rangle$ , so lemma holds. It holds after execution of both queue operations:
- ▶  $v_1$  is removed so  $v_2$  is new leader (if Q is emptied, it holds trivially). By IH,  $d[v_1] \leq d[v_2]$ . But then,  $d[v_r] \leq d[v_1] + 1 \leq d[v_2] + 1$  and the rest of inequalities is unchanged.

#### Lemma 4.

During the execution of BFS on G = (V, E), let queue Q contains vertices  $\langle v_1, v_2, \ldots, v_r \rangle$ , where  $v_1$  is the front item of Q (leader) and  $v_r$  is the last item of Q. Then,  $d[v_r] \leq d[v_1] + 1$  and  $d[v_i] \leq d[v_{i+1}]$  for  $i = 1, 2, \ldots, r - 1$ .

#### Proof.

- ▶ By induction on the number of queue operations. First, Q = ⟨s⟩, so lemma holds. It holds after execution of both queue operations:
- ▶  $v_1$  is removed so  $v_2$  is new leader (if Q is emptied, it holds trivially). By IH,  $d[v_1] \leq d[v_2]$ . But then,  $d[v_r] \leq d[v_1] + 1 \leq d[v_2] + 1$  and the rest of inequalities is unchanged.

v<sub>r+1</sub> is inserted into Q (line 17). In that time, u (whose adjacency list is being explored) is already removed from Q. By IH, d[u] ≤ d[v<sub>1</sub>]. So, d[v<sub>r+1</sub>] = d[u] + 1 ≤ d[v<sub>1</sub>] + 1. Therefore, d[v<sub>r</sub>] ≤<sub>IH</sub> d[u] + 1 = d[v<sub>r+1</sub>]. The rest of inequalities is unchanged.

(日)

### **Corollary 5.**

Let vertices  $v_i$  and  $v_j$  are stored in the queue during the computation of BFS such that  $v_i$  is inserted before  $v_j$ . Then,  $d[v_i] \le d[v_j]$  in the moment of insertion of  $v_j$  into the queue.

#### Proof.

By the previous lemma and the property that every vertex obtains final value of d at most once during the computation of BFS.

#### Theorem 6 (Correctness of BFS).

Let G = (V, E) be (di)graph and  $s \in V$ . Then, BFS(G, s) explores all vertices  $v \in V$  reachable from s and after it is finished  $d[v] = \delta(s, v)$  for all  $v \in V$ . In addition, for every vertex  $v \neq s$  reachable from s one of the shortest paths from s to v is a shortest path from s to  $\pi[v]$  followed by edge  $(\pi[v], v)$ .

Proof.

▶ By contradiction. Let v is a vertex with minimal  $\delta(s, v)$  such that  $d[v] \neq \delta(s, v)$ . Obviously,  $v \neq s$ .

#### Theorem 6 (Correctness of BFS).

Let G = (V, E) be (di)graph and  $s \in V$ . Then, BFS(G, s) explores all vertices  $v \in V$  reachable from s and after it is finished  $d[v] = \delta(s, v)$  for all  $v \in V$ . In addition, for every vertex  $v \neq s$  reachable from s one of the shortest paths from s to v is a shortest path from s to  $\pi[v]$  followed by edge  $(\pi[v], v)$ .

Proof.

- ▶ By contradiction. Let v is a vertex with minimal  $\delta(s, v)$  such that  $d[v] \neq \delta(s, v)$ . Obviously,  $v \neq s$ .
- ► Lemma 3 states that  $d[v] \ge \delta(s, v)$ , therefore  $d[v] > \delta(s, v)$ . In addition, v must be reachable from s, otherwise  $\delta(s, v) = \infty \ge d[v]$ .

#### Theorem 6 (Correctness of BFS).

Let G = (V, E) be (di)graph and  $s \in V$ . Then, BFS(G, s) explores all vertices  $v \in V$  reachable from s and after it is finished  $d[v] = \delta(s, v)$  for all  $v \in V$ . In addition, for every vertex  $v \neq s$  reachable from s one of the shortest paths from s to v is a shortest path from s to  $\pi[v]$  followed by edge  $(\pi[v], v)$ .

Proof.

- ▶ By contradiction. Let v is a vertex with minimal  $\delta(s, v)$  such that  $d[v] \neq \delta(s, v)$ . Obviously,  $v \neq s$ .
- ► Lemma 3 states that  $d[v] \ge \delta(s, v)$ , therefore  $d[v] > \delta(s, v)$ . In addition, v must be reachable from s, otherwise  $\delta(s, v) = \infty \ge d[v]$ .
- Let u be a vertex preceding v on a shortest path from s to v; that is, δ(s,v) = δ(s,u) + 1. Since δ(s,u) < δ(s,v) and with respect to the choice of v, d[u] = δ(s,u).

#### Theorem 6 (Correctness of BFS).

Let G = (V, E) be (di)graph and  $s \in V$ . Then, BFS(G, s) explores all vertices  $v \in V$  reachable from s and after it is finished  $d[v] = \delta(s, v)$  for all  $v \in V$ . In addition, for every vertex  $v \neq s$  reachable from s one of the shortest paths from s to v is a shortest path from s to  $\pi[v]$  followed by edge  $(\pi[v], v)$ .

Proof.

- ▶ By contradiction. Let v is a vertex with minimal  $\delta(s, v)$  such that  $d[v] \neq \delta(s, v)$ . Obviously,  $v \neq s$ .
- ► Lemma 3 states that  $d[v] \ge \delta(s, v)$ , therefore  $d[v] > \delta(s, v)$ . In addition, v must be reachable from s, otherwise  $\delta(s, v) = \infty \ge d[v]$ .
- Let *u* be a vertex preceding *v* on a shortest path from *s* to *v*; that is,  $\delta(s,v) = \delta(s,u) + 1$ . Since  $\delta(s,u) < \delta(s,v)$  and with respect to the choice of *v*,  $d[u] = \delta(s,u)$ .
- ► Altogether,  $d[v] > \delta(s, v) = \delta(s, u) + 1 = d[u] + 1$ .

Consider BFS in the moment when we dequeue u from Q (line 11), i.e. v is either WHITE, GREY, or BLACK.

- Consider BFS in the moment when we dequeue u from Q (line 11), i.e. v is either WHITE, GREY, or BLACK.
- ▶ v is WHITE, then line 15 sets d[v] = d[u] + 1 contradiction.

- Consider BFS in the moment when we dequeue u from Q (line 11), i.e. v is either WHITE, GREY, or BLACK.
- ▶ v is WHITE, then line 15 sets d[v] = d[u] + 1 contradiction.
- v is BLACK, then v is already dequeued from Q and by Corollary 5, d[v] ≤ d[u] − contradiction.

- Consider BFS in the moment when we dequeue u from Q (line 11), i.e. v is either WHITE, GREY, or BLACK.
- ▶ v is WHITE, then line 15 sets d[v] = d[u] + 1 contradiction.
- ▶ v is BLACK, then v is already dequeued from Q and by Corollary 5,  $d[v] \le d[u]$  contradiction.
- v is GREY, then v is greyed during picking another vertex w that was dequeued from Q before u. In addition, d[v] = d[w] + 1. By Corollary 5, d[w] ≤ d[u], i.e. d[v] ≤ d[u] + 1 contradiction.

- Consider BFS in the moment when we dequeue u from Q (line 11), i.e. v is either WHITE, GREY, or BLACK.
- ▶ v is WHITE, then line 15 sets d[v] = d[u] + 1 contradiction.
- ▶ v is BLACK, then v is already dequeued from Q and by Corollary 5,  $d[v] \le d[u]$  contradiction.
- v is GREY, then v is greyed during picking another vertex w that was dequeued from Q before u. In addition, d[v] = d[w] + 1. By Corollary 5, d[w] ≤ d[u], i.e. d[v] ≤ d[u] + 1 contradiction.
- ► Therefore,  $d[v] = \delta(s, v)$  for all  $v \in V$ . Furthermore, all vertices reachable from s must be visited, otherwise its d value is infinity.

- Consider BFS in the moment when we dequeue u from Q (line 11), i.e. v is either WHITE, GREY, or BLACK.
- ▶ v is WHITE, then line 15 sets d[v] = d[u] + 1 contradiction.
- ▶ v is BLACK, then v is already dequeued from Q and by Corollary 5,  $d[v] \le d[u]$  contradiction.
- v is GREY, then v is greyed during picking another vertex w that was dequeued from Q before u. In addition, d[v] = d[w] + 1. By Corollary 5, d[w] ≤ d[u], i.e. d[v] ≤ d[u] + 1 contradiction.
- ► Therefore,  $d[v] = \delta(s, v)$  for all  $v \in V$ . Furthermore, all vertices reachable from s must be visited, otherwise its d value is infinity.
- ► Finally, observe that if π[v] = u, then d[v] = d[u] + 1; that is, a shortest path from s to v can be obtained by addition of edge (π[v], v) to the end of a shortest path from s to π[v].

Breadth-First Search Tree (BFS Tree)

► Let  $\pi$  be an array of predecessors computed by BFS(G,s) for some G = (V, E) and  $s \in V$ .

# Breadth-First Search Tree (BFS Tree)

- Let π be an array of predecessors computed by BFS(G,s) for some G = (V, E) and s ∈ V.
- ▶ Predecessor subgraph of *G* is defined as  $G_{\pi} = (V_{\pi}, E_{\pi})$ , where
- $\blacktriangleright \ V_{\pi} = \{v \in V : \pi[v] \neq \text{NIL}\} \cup \{s\} \text{ and }$
- $E_{\pi} = \{(\pi[v], v) : v \in V_{\pi} \{s\}\}.$

# Breadth-First Search Tree (BFS Tree)

- Let π be an array of predecessors computed by BFS(G,s) for some G = (V, E) and s ∈ V.
- ▶ Predecessor subgraph of *G* is defined as  $G_{\pi} = (V_{\pi}, E_{\pi})$ , where

• 
$$V_{\pi} = \{v \in V : \pi[v] \neq \text{NIL}\} \cup \{s\}$$
 and

• 
$$E_{\pi} = \{ (\pi[v], v) : v \in V_{\pi} - \{s\} \}.$$

- G<sub>π</sub> is BFS tree, if V<sub>π</sub> contains only vertices reachable from s and for all v ∈ V<sub>π</sub>, there exists the only path from s to v that is the shortest path.
- Since  $G_{\pi}$  is connected and  $|E_{\pi}| = |V_{\pi}| 1$ ,  $G_{\pi}$  is a tree.

Let G be (di)graph. Procedure BFS constructs  $\pi$  such that  $G_{\pi}$  is BFS tree.

Proof.

▶ Line 16 of BFS sets  $\pi[v] = u$  iff  $(u, v) \in E$  and  $\delta(s, v) < \infty$ .

Let G be (di)graph. Procedure BFS constructs  $\pi$  such that  $G_{\pi}$  is BFS tree.

Proof.

- ▶ Line 16 of BFS sets  $\pi[v] = u$  iff  $(u, v) \in E$  and  $\delta(s, v) < \infty$ .
- $V_{\pi}$  contains only vertices reachable from s.

Let G be (di)graph. Procedure BFS constructs  $\pi$  such that  $G_{\pi}$  is BFS tree.

Proof.

- ▶ Line 16 of BFS sets  $\pi[v] = u$  iff  $(u, v) \in E$  and  $\delta(s, v) < \infty$ .
- $V_{\pi}$  contains only vertices reachable from s.
- Since G<sub>π</sub> is tree, G<sub>π</sub> contains only one path from s to each other vertex.

Let G be (di)graph. Procedure BFS constructs  $\pi$  such that  $G_{\pi}$  is BFS tree.

Proof.

- ▶ Line 16 of BFS sets  $\pi[v] = u$  iff  $(u, v) \in E$  and  $\delta(s, v) < \infty$ .
- $V_{\pi}$  contains only vertices reachable from s.
- Since G<sub>π</sub> is tree, G<sub>π</sub> contains only one path from s to each other vertex.
- By inductive application of Theorem 6, each such path is a shortest one.

How to print the shortest path from s to v?

```
PRINT-PATH(G, s, v)

1 if v = s

2 then print s

3 else if \pi[v] = \text{NIL}

4 then print "No path from " s " to " v "!"

5 else PRINT-PATH(G, s, \pi[v])

6 print v
```

Its time complexity is O(n).

## Exercises

- 1. Given an example of a directed graph G = (V, E), a source vertex  $s \in V$ , and a set of tree edges  $E_{\pi} \subseteq E$  such that for each vertex  $v \in V$ , the unique simple path in the graph  $(V, E_{\pi})$  from s to v is a shortest path in G, yet  $E_{\pi}$  cannot be produced by running BFS(G, s), no matter how the vertices are ordered in each adjacency list.
- 2. Give an efficient algorithm to compute whether the given undirected graph is bipartite.
- 3. The diameter of a tree T = (V, E) is defined as  $max_{u,v \in V}\delta(u, v)$ , that is, the largest of all shortest-path distances in the tree. Give an efficient algorithm to compute the diameter of a tree, and analyze the running time of your algorithm.

# Time Complexity of $\mathrm{DFS}\text{-}\mathrm{VISIT}$

DFS-VISIT(G, u)  
1 
$$color[u] \leftarrow GREY$$
  
2  $time \leftarrow time + 1$   
3  $d[u] \leftarrow time$   
4 **for** each  $v \in Adj[u]$   
5 **if**  $color[v] = WHITE$   
6 **then**  $\pi[v] \leftarrow u$   
7 DFS-VISIT(G, v)  
8  $color[u] \leftarrow BLACK$   
9  $time \leftarrow time + 1$   
10  $f[u] \leftarrow time$ 

- ▶ DFS-VISIT is called only for white vertices and DFS-VISIT immediately changes their color to GREY. So, DFS-VISIT is called exactly once for each vertex  $v \in V$ .
- For each vertex v, the loop on lines 4–7 iterates |Adj[v]|-times.
- Since  $\sum_{v \in V} |Adj[v]| = \Theta(m)$ , the total cost of lines 4–7 is  $\Theta(m)$ .
- Therefore, the running time is  $\Theta(m+n)$ .

# Parenthesis Theorem

In any DFS of a graph G = (V, E), for any two vertices u and v, exactly one of the following conditions holds:

- ▶ intervals [d[u], f[u]] and [d[v], f[v]] are disjoint, and neither u nor v is descendant of the other in DFS forest,
- ▶ interval [d[u], f[u]] is contained within the interval [d[v], f[v]] and u is a descendant of v in a DFS tree, or
- ▶ interval [d[v], f[v]] is contained within the interval [d[u], f[u]] and v is a descendant of u in a DFS tree.

# Parenthesis Theorem

In any DFS of a graph G = (V, E), for any two vertices u and v, exactly one of the following conditions holds:

- ▶ intervals [d[u], f[u]] and [d[v], f[v]] are disjoint, and neither u nor v is descendant of the other in DFS forest,
- ▶ interval [d[u], f[u]] is contained within the interval [d[v], f[v]] and u is a descendant of v in a DFS tree, or
- ▶ interval [d[v], f[v]] is contained within the interval [d[u], f[u]] and v is a descendant of u in a DFS tree.

# Proof for d[u] < d[v] (Homework: prove case d[v] < d[u]).

 Subcase d[v] < f[u]: Then, v was discovered while u was still GREY. Since v was discovered later than u, v is finished before u. Hence, f[v] < f[u].</li>

# Parenthesis Theorem

In any DFS of a graph G = (V, E), for any two vertices u and v, exactly one of the following conditions holds:

- ▶ intervals [d[u], f[u]] and [d[v], f[v]] are disjoint, and neither u nor v is descendant of the other in DFS forest,
- ▶ interval [d[u], f[u]] is contained within the interval [d[v], f[v]] and u is a descendant of v in a DFS tree, or
- ▶ interval [d[v], f[v]] is contained within the interval [d[u], f[u]] and v is a descendant of u in a DFS tree.

# Proof for d[u] < d[v] (Homework: prove case d[v] < d[u]).

- Subcase d[v] < f[u]: Then, v was discovered while u was still GREY. Since v was discovered later than u, v is finished before u. Hence, f[v] < f[u].</p>
- Subcase f[u] < d[v]: Then, from the definition d[u] < f[u] and d[v] < f[v], so both intervals are disjoint. Moreover, neither vertex was discovered while the other was GREY, and so neither vertex is a descendant of the other.

#### Corollary 8.

Vertex v is descendant of vertex u in DFS forest of G = (V, E) iff

In DFS forest of graph G = (V, E), vertex v is descendant of vertex u iff in time d[u] there is a path from u to v from WHITE vertices only.

In DFS forest of graph G = (V, E), vertex v is descendant of vertex u iff in time d[u] there is a path from u to v from WHITE vertices only. Proof.

⇒: Let v be descendant of u. Let w be a vertex on the path from u to v in the DFS forest. Since w is descendant of u and by the previous corollary, it holds that d[u] < d[w]. So, w is WHITE in time d[u].

In DFS forest of graph G = (V, E), vertex v is descendant of vertex u iff in time d[u] there is a path from u to v from WHITE vertices only. Proof.

- ⇒: Let v be descendant of u. Let w be a vertex on the path from u to v in the DFS forest. Since w is descendant of u and by the previous corollary, it holds that d[u] < d[w]. So, w is WHITE in time d[u].
- $\Leftarrow$ : Let v be the nearest vertex of u reachable from u in time d[u] by some WHITE path such that v is not a descendant of u in DFS forest.

In DFS forest of graph G = (V, E), vertex v is descendant of vertex u iff in time d[u] there is a path from u to v from WHITE vertices only.

- $\Rightarrow$ : Let v be descendant of u. Let w be a vertex on the path from u to v in the DFS forest. Since w is descendant of u and by the previous corollary, it holds that d[u] < d[w]. So, w is WHITE in time d[u].
- $\Leftarrow$ : Let v be the nearest vertex of u reachable from u in time d[u] by some WHITE path such that v is not a descendant of u in DFS forest.
  - ▶ Let w be predecessor of v on the WHITE path. Then, w is descendant of u and, by the previous corollary,  $f[w] \leq f[u]$  (w can coincide with u).

In DFS forest of graph G = (V, E), vertex v is descendant of vertex u iff in time d[u] there is a path from u to v from WHITE vertices only.

- $\Rightarrow$ : Let v be descendant of u. Let w be a vertex on the path from u to v in the DFS forest. Since w is descendant of u and by the previous corollary, it holds that d[u] < d[w]. So, w is WHITE in time d[u].
- $\Leftarrow$ : Let v be the nearest vertex of u reachable from u in time d[u] by some WHITE path such that v is not a descendant of u in DFS forest.
  - ▶ Let w be predecessor of v on the WHITE path. Then, w is descendant of u and, by the previous corollary,  $f[w] \leq f[u]$  (w can coincide with u).
  - Since v must be discovered after u but before finishing w, we have d[u] < d[v] < f[w] ≤ f[u].</p>

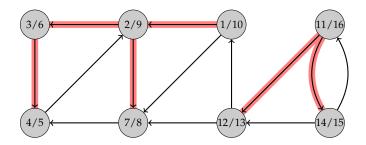

In DFS forest of graph G = (V, E), vertex v is descendant of vertex u iff in time d[u] there is a path from u to v from WHITE vertices only.

- $\Rightarrow$ : Let v be descendant of u. Let w be a vertex on the path from u to v in the DFS forest. Since w is descendant of u and by the previous corollary, it holds that d[u] < d[w]. So, w is WHITE in time d[u].
- $\Leftarrow$ : Let v be the nearest vertex of u reachable from u in time d[u] by some WHITE path such that v is not a descendant of u in DFS forest.
  - ▶ Let w be predecessor of v on the WHITE path. Then, w is descendant of u and, by the previous corollary,  $f[w] \leq f[u]$  (w can coincide with u).
  - Since v must be discovered after u but before finishing w, we have d[u] < d[v] < f[w] ≤ f[u].</p>
  - Parenthesis Theorem says that interval [d[v], f[v]] is completely included in interval [d[u], f[u]]. And by the previous corollary, v is descendant of u.

# **Edge Classification**

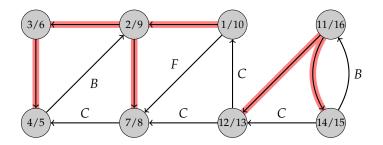

- 1. **Tree edges** are edges in DFS forest  $G_{\pi}$ . (u, v) is a tree edge if v was firstly discovered by exploring edge (u, v). These edges are highlighted using red color in the figures.
- 2. Back edges are edges (u, v) connecting u to its predecessor v in DFS forest. Self-loop is always back edge.
- 3. Forward edges are non-tree edges (u, v) connecting u to its descendant v in DFS forest.
- 4. Cross edges are all other edges.

# Drawing a Graph

We can draw every graph such that tree and forward edges lead downwards and back edges lead upwards.

・ロト ・四ト ・ヨト ・ヨト

Let (u, v) be an edge. Then, using a color of v during DFS computation, we can classify (u, v) as follows:

1. WHITE indicates a tree edge,

# DFS and Edge Classification

Let (u, v) be an edge. Then, using a color of v during DFS computation, we can classify (u, v) as follows:

- 1. WHITE indicates a tree edge,
- 2. GREY indicates a back edge, and

# DFS and Edge Classification

Let (u, v) be an edge. Then, using a color of v during DFS computation, we can classify (u, v) as follows:

67 / 252

- 1. WHITE indicates a tree edge,
- 2. GREY indicates a back edge, and
- 3. BLACK indicates a forward or cross edge:
  - (u, v) is a forward edge, if d[u] < d[v].
  - (u,v) is a cross edge, if d[u] > d[v].

#### Theorem 9.

During the DFS computation of undirected graph G, each edge is either a tree edge or a back edge.

Proof.

• Let (u, v) is an arbitrary edge of G and let d[u] < d[v].

#### Theorem 9.

During the DFS computation of undirected graph G, each edge is either a tree edge or a back edge.

- Let (u, v) is an arbitrary edge of G and let d[u] < d[v].
- Then, v becomes BLACK while u is still GREY.

### Theorem 9.

During the DFS computation of undirected graph G, each edge is either a tree edge or a back edge.

- Let (u, v) is an arbitrary edge of G and let d[u] < d[v].
- Then, v becomes BLACK while u is still GREY.
- If (u, v) is firstly explored in the direction from u to v, then v is WHITE – otherwise we would have explored (u, v) in the other direction (from v to u). Thus, (u, v) is a tree edge.

### Theorem 9.

During the DFS computation of undirected graph G, each edge is either a tree edge or a back edge.

Proof.

- Let (u, v) is an arbitrary edge of G and let d[u] < d[v].
- Then, v becomes BLACK while u is still GREY.
- If (u, v) is firstly explored in the direction from u to v, then v is WHITE – otherwise we would have explored (u, v) in the other direction (from v to u). Thus, (u, v) is a tree edge.
- If (u, v) is firstly explored in the direction from v to u, u is still GREY
   - since u is still GREY at the time the edge is explored for the first
   time, then (u, v) is a back edge.

Topological sort – Example

# **Lemma 10.** Digraph G is acyclic iff DFS(G) finds no back edge.

Digraph G is acyclic iff DFS(G) finds no back edge.

Proof.

 $\Rightarrow$ : Let (u, v) be a back edge. Then, u is descendant of v in DFS forest; that is, there is a path from v to u. So edge (u, v) closes a cycle.

Digraph G is acyclic iff DFS(G) finds no back edge.

- $\Rightarrow: \text{Let } (u,v) \text{ be a back edge. Then, } u \text{ is descendant of } v \text{ in DFS forest;} \\ \text{that is, there is a path from } v \text{ to } u. \text{ So edge } (u,v) \text{ closes a cycle.} \end{cases}$
- $\Leftarrow:$  Let G contain a cycle, c. Let us show that then  $\mathrm{DFS}(G)$  finds a back edge.

Digraph G is acyclic iff DFS(G) finds no back edge.

- $\Rightarrow: \text{Let } (u,v) \text{ be a back edge. Then, } u \text{ is descendant of } v \text{ in DFS forest;} \\ \text{that is, there is a path from } v \text{ to } u. \text{ So edge } (u,v) \text{ closes a cycle.} \end{cases}$
- $\Leftarrow:$  Let G contain a cycle, c. Let us show that then  $\mathrm{DFS}(G)$  finds a back edge.
- Let v be the first vertex of c discovered by DFS(G) procedure and let (u, v) be an edge that completes cycle c.

Digraph G is acyclic iff DFS(G) finds no back edge.

- $\Rightarrow$ : Let (u, v) be a back edge. Then, u is descendant of v in DFS forest; that is, there is a path from v to u. So edge (u, v) closes a cycle.
- $\Leftarrow:$  Let G contain a cycle, c. Let us show that then  $\mathrm{DFS}(G)$  finds a back edge.
  - Let v be the first vertex of c discovered by DFS(G) procedure and let (u, v) be an edge that completes cycle c.
  - ln time d[v], the edges of cycle c determine WHITE path from v to u.

Digraph G is acyclic iff DFS(G) finds no back edge.

Proof.

- $\Rightarrow$ : Let (u, v) be a back edge. Then, u is descendant of v in DFS forest; that is, there is a path from v to u. So edge (u, v) closes a cycle.
- $\Leftarrow:$  Let G contain a cycle, c. Let us show that then  $\mathrm{DFS}(G)$  finds a back edge.
  - Let v be the first vertex of c discovered by DFS(G) procedure and let (u, v) be an edge that completes cycle c.
  - ln time d[v], the edges of cycle c determine WHITE path from v to u.
  - By WHITE path theorem, it holds that u is descendant of v in DFS forest. Therefore, (u, v) is a back edge.

Lemma 13.

Let C, C' be two different SCCs of a digraph G = (V, E). Let  $(u, v) \in E$ ,  $u \in C$ ,  $v \in C'$ . Then, f(C) > f(C').

### Lemma 13.

Let C, C' be two different SCCs of a digraph G = (V, E). Let  $(u, v) \in E$ ,  $u \in C$ ,  $v \in C'$ . Then, f(C) > f(C').

Proof

▶ 1) d(C) < d(C') - let x be the first discovered vertex in C. In time d[x], all vertices from  $C \cup C'$  are WHITE. For  $w \in C'$  there exists a WHITE path  $x \rightsquigarrow u \rightarrow v \rightsquigarrow w$ . By WHITE path theorem, all vertices from  $C \cup C'$  are descendants of x in its DFS tree. Then, collorary from Parenthesis theorem says that f[x] = f(C) > f(C').

### Lemma 13.

Let C, C' be two different SCCs of a digraph G = (V, E). Let  $(u, v) \in E$ ,  $u \in C$ ,  $v \in C'$ . Then, f(C) > f(C').

### Proof

- ▶ 1) d(C) < d(C') let x be the first discovered vertex in C. In time d[x], all vertices from  $C \cup C'$  are WHITE. For  $w \in C'$  there exists a WHITE path  $x \rightsquigarrow u \rightarrow v \rightsquigarrow w$ . By WHITE path theorem, all vertices from  $C \cup C'$  are descendants of x in its DFS tree. Then, collorary from Parenthesis theorem says that f[x] = f(C) > f(C').
- ▶ 2) d(C) > d(C') let y be the first discovered in C'. In time d[y], all vertices from C' are WHITE and there exists a WHITE path from y to every vertex of C'. By WHITE path theorem and corollary of Parenthesis theorem, we have f[y] = f(C').

イロト (日本 (日本 (日本 )))

### Lemma 13.

Let C, C' be two different SCCs of a digraph G = (V, E). Let  $(u, v) \in E$ ,  $u \in C$ ,  $v \in C'$ . Then, f(C) > f(C').

- ▶ 1) d(C) < d(C') let x be the first discovered vertex in *C*. In time d[x], all vertices from  $C \cup C'$  are WHITE. For  $w \in C'$  there exists a WHITE path  $x \rightsquigarrow u \rightarrow v \rightsquigarrow w$ . By WHITE path theorem, all vertices from  $C \cup C'$  are descendants of x in its DFS tree. Then, collorary from Parenthesis theorem says that f[x] = f(C) > f(C').
- 2) d(C) > d(C') let y be the first discovered in C'. In time d[y], all vertices from C' are WHITE and there exists a WHITE path from y to every vertex of C'. By WHITE path theorem and corollary of Parenthesis theorem, we have f[y] = f(C'). In time d[y], all vertices from C are WHITE. From the previous lemma, there is no path from C' to C. Therefore, vertices from C are WHITE in time f[y] too. That is, f[w] > f[y], w ∈ C, which gives us f(C) > f(C').

### Corollary 14.

Let C, C' be two different SCCs of a digraph G = (V, E). Let  $(u, v) \in E^T$ ,  $u \in C$ ,  $v \in C'$ . Then, f(C) < f(C').

## Corollary 14.

Let C, C' be two different SCCs of a digraph G = (V, E). Let  $(u, v) \in E^T$ ,  $u \in C$ ,  $v \in C'$ . Then, f(C) < f(C').

#### Proof.

 $(u, v) \in E^T$  implies that  $(v, u) \in E$ . Since SCCs of G and SCCs of  $G^T$  coincide, the previous lemma implies f(C) < f(C').

## Corollary 14.

Let C, C' be two different SCCs of a digraph G = (V, E). Let  $(u, v) \in E^T$ ,  $u \in C$ ,  $v \in C'$ . Then, f(C) < f(C').

#### Proof.

 $(u, v) \in E^T$  implies that  $(v, u) \in E$ . Since SCCs of G and SCCs of  $G^T$  coincide, the previous lemma implies f(C) < f(C').

## Closing times of the second DFS

Observe that  $f_3(C) > f_3(C')$  so  $(u, v) \in E^T$  is a cross edge according to the classification from the second DFS.

Scc(G) procedure is correct.

Scc(G) procedure is correct.

## Proof

By induction on the number of DFS trees found at line 3. IH: First k trees found by line 3 of SCC(G) are SCCs. IB: Trivial for k = 0.

Scc(G) procedure is correct.

- By induction on the number of DFS trees found at line 3. IH: First k trees found by line 3 of SCC(G) are SCCs. IB: Trivial for k = 0.
- ► IS: Assume (k+1)-th found tree. Let u be its root and let u be in a SCC C.

Scc(G) procedure is correct.

- By induction on the number of DFS trees found at line 3. IH: First k trees found by line 3 of SCC(G) are SCCs. IB: Trivial for k = 0.
- ► IS: Assume (k+1)-th found tree. Let u be its root and let u be in a SCC C.
- f[u] = f(C) > f(C') for any SCC C' (different from C) that is not visited yet.

Scc(G) procedure is correct.

- By induction on the number of DFS trees found at line 3. IH: First k trees found by line 3 of SCC(G) are SCCs. IB: Trivial for k = 0.
- ► IS: Assume (k+1)-th found tree. Let u be its root and let u be in a SCC C.
- ▶ f[u] = f(C) > f(C') for any SCC C' (different from C) that is not visited yet.
- ▶ By IH, in time d<sub>3</sub>[u] all vertices in C are WHITE. By White Path Theorem, the rest of vertices from C are descendants of u in a DFS tree.

Scc(G) procedure is correct.

## Proof

- By induction on the number of DFS trees found at line 3. IH: First k trees found by line 3 of SCC(G) are SCCs. IB: Trivial for k = 0.
- ► IS: Assume (k+1)-th found tree. Let u be its root and let u be in a SCC C.
- ▶ f[u] = f(C) > f(C') for any SCC C' (different from C) that is not visited yet.
- ▶ By IH, in time d<sub>3</sub>[u] all vertices in C are WHITE. By White Path Theorem, the rest of vertices from C are descendants of u in a DFS tree.
- By IH and the previous corollary, every edge of G<sup>T</sup> leads from C to some already visited SCC.

Scc(G) procedure is correct.

- By induction on the number of DFS trees found at line 3. IH: First k trees found by line 3 of SCC(G) are SCCs. IB: Trivial for k = 0.
- ► IS: Assume (k+1)-th found tree. Let u be its root and let u be in a SCC C.
- f[u] = f(C) > f(C') for any SCC C' (different from C) that is not visited yet.
- ▶ By IH, in time d<sub>3</sub>[u] all vertices in C are WHITE. By White Path Theorem, the rest of vertices from C are descendants of u in a DFS tree.
- By IH and the previous corollary, every edge of G<sup>T</sup> leads from C to some already visited SCC.
- So no vertex from another SCC (different from C) is descendant of u during DFS of G<sup>T</sup>. Therefore, the vertices of the tree form an SCC.

## Exercises

- 1. How can the number of strongly connected components of a graph change if a new edge is added?
- 2. Give an O(n+m)-time algorithm to compute the component graph of digraph G = (V, E). Make sure that there is at most one edge between two vertices in the resulting graph (*E* is not a multiset).

# Minimum Spanning Trees

# Minimum Spanning Tree (MST)

- The first algorithm by mathematician from Brno, O. Borůvka, 1926 (in Czech).
- Let G = (V, E) be a connected undirected graph with weight function

 $w: E \to \mathbb{R}$ .

▶ Goal: Find a subset of edges  $T \subseteq E$  such that subgraph (V, T) is connected, acyclic and

$$w(T) = \sum_{(u,v)\in T} w(u,v)$$

is minimal.

# Minimum Spanning Tree – Example

# Generic Algorithm

```
GENERIC-MST(G, w)

1 A \leftarrow \emptyset

2 while A does not form a spanning tree

3 do find an edge (u, v) \in E that is safe for A

4 A \leftarrow A \cup \{(u, v)\}

5 return A
```

- Loop invariant: Prior to each iteration, A is a subset of some MST.
- ► Edge (u, v) ∈ E is safe edge for A, since A ∪ {(u, v)} maintains the invariant.
- Note: Greedy algorithm making choice that is the best at the moment.

## ▶ A cut of G = (V, E) is a pair (S, V - S) of $V, S \subseteq V$ .

- ▶ A cut of G = (V, E) is a pair (S, V S) of  $V, S \subseteq V$ .
- An edge (u, v) ∈ E crosses the cut (S, V − S) if one of endpoints is in S and the other in V − S.

- ▶ A cut of G = (V, E) is a pair (S, V S) of  $V, S \subseteq V$ .
- An edge (u, v) ∈ E crosses the cut (S, V − S) if one of endpoints is in S and the other in V − S.
- ► A cut respects a set of edges A if no edge from A crosses the cut.

- ▶ A cut of G = (V, E) is a pair (S, V S) of  $V, S \subseteq V$ .
- An edge (u, v) ∈ E crosses the cut (S, V − S) if one of endpoints is in S and the other in V − S.
- ► A cut respects a set of edges A if no edge from A crosses the cut.
- An edge is a light edge crossing a cut if its weight is the minimum of any edge crossing the cut.

A ロ ト 4 回 ト 4 三 ト 4 三 ト 9 0 0 0

- Let G = (V, E) be a connected, undirected graph with real-valued weight function w.
- Let  $A \subseteq E$  is included in some MST for G.
- Let (S, V S) be any cut of G that respects A.
- Let (u, v) be a light edge crossing (S, V S).

Then, edge (u, v) is safe for A.

- Let G = (V, E) be a connected, undirected graph with real-valued weight function w.
- Let  $A \subseteq E$  is included in some MST for G.
- Let (S, V S) be any cut of G that respects A.
- Let (u, v) be a light edge crossing (S, V S).

Then, edge (u, v) is safe for A.

## Proof

▶ Let T be a MST for G,  $A \subseteq T$ ,  $(u, v) \notin T$ .

- Let G = (V, E) be a connected, undirected graph with real-valued weight function w.
- Let  $A \subseteq E$  is included in some MST for G.
- Let (S, V S) be any cut of G that respects A.
- Let (u, v) be a light edge crossing (S, V S).

Then, edge (u, v) is safe for A.

- Let T be a MST for G,  $A \subseteq T$ ,  $(u, v) \notin T$ .
- u → v is a path in T, and by adding (u, v) we create a cycle. E.g. let u ∈ S and v ∈ V − S.

- Let G = (V, E) be a connected, undirected graph with real-valued weight function w.
- Let  $A \subseteq E$  is included in some MST for G.
- Let (S, V S) be any cut of G that respects A.
- Let (u, v) be a light edge crossing (S, V S).

Then, edge (u, v) is safe for A.

#### Proof

- Let T be a MST for G,  $A \subseteq T$ ,  $(u, v) \notin T$ .
- u → v is a path in T, and by adding (u, v) we create a cycle. E.g. let u ∈ S and v ∈ V − S.
- ▶ Let (x, y) lies on  $u \rightsquigarrow v$  in *T* crossing (S, V S). Since, the cut respects *A*,  $(x, y) \notin A$ .

- Let G = (V, E) be a connected, undirected graph with real-valued weight function w.
- Let  $A \subseteq E$  is included in some MST for G.
- Let (S, V S) be any cut of G that respects A.
- Let (u, v) be a light edge crossing (S, V S).

Then, edge (u, v) is safe for A.

- Let T be a MST for G,  $A \subseteq T$ ,  $(u, v) \notin T$ .
- *u* → *v* is a path in *T*, and by adding (*u*, *v*) we create a cycle. E.g. let *u* ∈ *S* and *v* ∈ *V* − *S*.
- Let (x, y) lies on  $u \rightsquigarrow v$  in T crossing (S, V S). Since, the cut respects A,  $(x, y) \notin A$ .
- ▶  $T' = (T \{(x, y)\}) \cup \{(u, v)\}$  is a spanning tree of G. Is T' minimal?

• (u, v) is light edge crossing (S, V - S) and (x, y) crossing the cut as well, so  $w(u, v) \le w(x, y)$ .

- (u, v) is light edge crossing (S, V S) and (x, y) crossing the cut as well, so  $w(u, v) \le w(x, y)$ .
- ► Hence,  $w(T') = w(T) w(x,y) + w(u,v) \le w(T)$ .

- (u, v) is light edge crossing (S, V S) and (x, y) crossing the cut as well, so  $w(u, v) \le w(x, y)$ .
- Hence,  $w(T') = w(T) w(x,y) + w(u,v) \le w(T)$ .
- ▶ T is a MST, therefore  $w(T) \le w(T')$ .

- (u, v) is light edge crossing (S, V S) and (x, y) crossing the cut as well, so  $w(u, v) \le w(x, y)$ .
- Hence,  $w(T') = w(T) w(x,y) + w(u,v) \le w(T)$ .
- ▶ T is a MST, therefore  $w(T) \le w(T')$ .
- Since  $A \subseteq T$  and  $(x, y) \notin A$ ,  $A \subseteq T'$ .

- (u, v) is light edge crossing (S, V S) and (x, y) crossing the cut as well, so  $w(u, v) \le w(x, y)$ .
- Hence,  $w(T') = w(T) w(x,y) + w(u,v) \le w(T)$ .
- ▶ T is a MST, therefore  $w(T) \le w(T')$ .
- Since  $A \subseteq T$  and  $(x, y) \notin A$ ,  $A \subseteq T'$ .
- Finally, A ∪ {(u, v)} ⊆ T'. Since T' is MST as well, (u, v) is safe for A.

## Exercises

- 1. Give a simple example of a connected graph G = (V, E) such that the set of edges  $\{(u, v) :$  there exists a cut (S, V S) such that (u, v) is a light edge crossing (S, V S) does not form a MST for G.
- 2. Show that a graph has a unique MST if, for every cut of the graph, there is a unique light edge crossing the cut. Show that the converse is not true by giving a counterexample.

Kruskal and Prim (Jarník) Algorithms – Principle

- Based on the generic greedy algorithm.
- Difference: How to pickup safe edge (line 3 of generic algorithm)?

Kruskal and Prim (Jarník) Algorithms – Principle

- Based on the generic greedy algorithm.
- Difference: How to pickup safe edge (line 3 of generic algorithm)?
- Kruskal: Set A forms a forest. Safe edge for A is an edge with the smallest weight connecting two different connected components.

Kruskal and Prim (Jarník) Algorithms – Principle

- Based on the generic greedy algorithm.
- Difference: How to pickup safe edge (line 3 of generic algorithm)?
- Kruskal: Set A forms a forest. Safe edge for A is an edge with the smallest weight connecting two different connected components.
- Prim (Jarník): Set A is a tree. Safe edge for A is an edge with the smallest weight connecting tree A with a (yet) non-tree vertex.

# Prim Algorithm

<ロト < 回 ト < 画 ト < 画 ト < 画 ト < 画 ト < 画 ト 102 / 252

# Min-Priority Queue

- Data structure for maintaining a set of elements, each with an associated key (priority)
- Duality with max-priority queue
- Use: to represent an dynamic set of vertices with given priorities

# Min-Priority Queue

- Data structure for maintaining a set of elements, each with an associated key (priority)
- Duality with max-priority queue
- Use: to represent an dynamic set of vertices with given priorities

### Operations

- ▶ INSERT(Q, v) inserts vertex v into queue Q ( $Q = Q \cup \{v\}$ ).
- EXTRACT-MIN(Q) removes and returns the element of Q with the smallest key.
- ▶ DECREASE-KEY(Q, v, k) decreases key of vertex v to new value k.

# Min-Priority Queue

- Data structure for maintaining a set of elements, each with an associated key (priority)
- Duality with max-priority queue
- Use: to represent an dynamic set of vertices with given priorities

### Operations

- ▶ INSERT(Q, v) inserts vertex v into queue Q ( $Q = Q \cup \{v\}$ ).
- EXTRACT-MIN(Q) removes and returns the element of Q with the smallest key.
- ▶ DECREASE-KEY(Q, v, k) decreases key of vertex v to new value k.

### Implementation (Data structure)

- ▶ Binary heap in array A[1..n] with A[PARENT(i)] ≤ A[i] (each operation: O(log n))
- ► Fibonacci heap (DECREASE-KEY only O(1))

# Prim algorithm

```

### Exercises

- 1. Show that for each MST T of G, there is a way to sort the edges of G in Kruskal's algorithm so that it returns T.
- 2. Suppose that we represent the graph G = (V, E) as an adjacency matrix. Give a simple implementation of Prim's algorithm for this case that runs in  $O(n^2)$  time.

# Single-Source Shortest Paths

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ ののの

## Shortest Paths

- Given weighted directed graph G = (V, E) and
- weight function  $w: E \to \mathbb{R}$ .

### Shortest Paths

- Given weighted directed graph G = (V, E) and
- weight function  $w: E \to \mathbb{R}$ .

• The weight of path 
$$p = \langle v_0, v_1, \dots, v_k 
angle$$
 is

$$w(p) = \sum_{i=1}^{k} w(v_{i-1}, v_i)$$

### Shortest Paths

- Given weighted directed graph G = (V, E) and
- weight function  $w: E \to \mathbb{R}$ .

• The weight of path 
$$p = \langle v_0, v_1, \dots, v_k 
angle$$
 is

$$w(p) = \sum_{i=1}^{k} w(v_{i-1}, v_i)$$

The shortest-path weight from u to v is

 $\delta(u,v) = \begin{cases} \min\{w(p) : u \stackrel{p}{\leadsto} v\} & \text{if there is a path from } u \text{ to } v \\ \infty & \text{otherwise} \end{cases}$ 

• A shortest path from u to v is any path p from u to v with  $w(p) = \delta(u, v)$ .

### Shortest Paths - Variants

- Single-source shortest-paths problem
- Single-destination shortest-paths problem by reversing the direction of each edge
- Single-pair shortest-path problem is there faster solution?
- All-pairs shortest-paths problem single-source from each vertex or faster?

#### Lemma 17.

Let G = (V, E) be directed graph with weight function  $w : E \to \mathbb{R}$ . Let  $p = \langle v_1, v_2, \ldots, v_k \rangle$  be a shortest path from  $v_1$  to  $v_k$ . For any  $1 \le i \le j \le k$ , let  $p_{ij} = \langle v_i, v_{i+1}, \ldots, v_j \rangle$  be the subpath of p from  $v_i$  to  $v_j$ . Then,  $p_{ij}$  is a shortest path from  $v_i$  to  $v_j$ .

Proof.

#### Lemma 17.

Let G = (V, E) be directed graph with weight function  $w : E \to \mathbb{R}$ . Let  $p = \langle v_1, v_2, \ldots, v_k \rangle$  be a shortest path from  $v_1$  to  $v_k$ . For any  $1 \le i \le j \le k$ , let  $p_{ij} = \langle v_i, v_{i+1}, \ldots, v_j \rangle$  be the subpath of p from  $v_i$  to  $v_j$ . Then  $v_i$  is a shortest path from  $v_i$  to  $v_i$ .

Then,  $p_{ij}$  is a shortest path from  $v_i$  to  $v_j$ .

#### Proof.

▶ 
$$p \text{ is } v_1 \overset{p_{1i}}{\leadsto} v_i \overset{p_{ij}}{\leadsto} v_j \overset{p_{jk}}{\leadsto} v_k$$
, where  $w(p) = w(p_{1i}) + w(p_{ij}) + w(p_{jk})$ .

#### Lemma 17.

Let G = (V, E) be directed graph with weight function  $w : E \to \mathbb{R}$ . Let  $p = \langle v_1, v_2, \ldots, v_k \rangle$  be a shortest path from  $v_1$  to  $v_k$ . For any  $1 \le i \le j \le k$ , let  $p_{ij} = \langle v_i, v_{i+1}, \ldots, v_j \rangle$  be the subpath of p from  $v_i$  to  $v_j$ . Then m is a shortest path from  $v_i$  to  $v_j$ .

Then,  $p_{ij}$  is a shortest path from  $v_i$  to  $v_j$ .

#### Proof.

- $\blacktriangleright \ p \text{ is } v_1 \overset{p_{1i}}{\rightsquigarrow} v_i \overset{p_{ij}}{\rightsquigarrow} v_j \overset{p_{jk}}{\rightsquigarrow} v_k \text{, where } w(p) = w(p_{1i}) + w(p_{ij}) + w(p_{jk}).$
- Assume that there is  $p'_{ij}$  from  $v_i$  to  $v_j$  with  $w(p'_{ij}) < w(p_{ij})$ .

#### Lemma 17.

Let G = (V, E) be directed graph with weight function  $w : E \to \mathbb{R}$ . Let  $p = \langle v_1, v_2, \ldots, v_k \rangle$  be a shortest path from  $v_1$  to  $v_k$ . For any  $1 \le i \le j \le k$ , let  $p_{ij} = \langle v_i, v_{i+1}, \ldots, v_j \rangle$  be the subpath of p from  $v_i$  to  $v_j$ . Then,  $p_{ij}$  is a shortest path from  $v_i$  to  $v_i$ .

Proof.

- $\blacktriangleright \ p \text{ is } v_1 \overset{p_{1i}}{\rightsquigarrow} v_i \overset{p_{ij}}{\rightsquigarrow} v_j \overset{p_{jk}}{\rightsquigarrow} v_k \text{, where } w(p) = w(p_{1i}) + w(p_{ij}) + w(p_{jk}).$
- Assume that there is  $p'_{ij}$  from  $v_i$  to  $v_j$  with  $w(p'_{ij}) < w(p_{ij})$ .

▶ Then,  $v_1 \xrightarrow{p_{1i}} v_i \xrightarrow{p'_{ij}} v_j \xrightarrow{p_{jk}} v_k$ , where  $w(p_{1i}) + w(p'_{ij}) + w(p_{jk}) < w(p)$ . Contradiction.

### Negative-weight edges

▶ If G contains no negative-weight cycles reachable from the source s, then for all  $v \in V$ ,  $\delta(s, v)$  remains well defined (even if negative).

# Negative-weight edges

- ▶ If G contains no negative-weight cycles reachable from the source s, then for all  $v \in V$ ,  $\delta(s, v)$  remains well defined (even if negative).
- If G contains a negative-weight cycle reachable from s, δ is not well defined repeating traverse of the negative-weight cycle.
- If there is negative-weight cycle on some path from s to v, we define δ(s, v) = −∞.

## Negative-weight edges

- ▶ If G contains no negative-weight cycles reachable from the source s, then for all  $v \in V$ ,  $\delta(s, v)$  remains well defined (even if negative).
- If G contains a negative-weight cycle reachable from s, δ is not well defined repeating traverse of the negative-weight cycle.
- If there is negative-weight cycle on some path from s to v, we define δ(s, v) = −∞.
- Note: There is always the shortest simple path, but not path. The algorithms work with paths ⇒ problem.

# Representing Shortest Paths

- Let G = (V, E) be a graph.
- $\pi[v]$  is set to a predecessor to v; that is, a vertex or NIL.
- ▶ Use procedure PRINT-PATH(G, s, v) to print the path from s to v stored in  $\pi$

# Representing Shortest Paths

- Let G = (V, E) be a graph.
- $\pi[v]$  is set to a predecessor to v; that is, a vertex or NIL.
- Use procedure PRINT-PATH(G, s, v) to print the path from s to v stored in π
- Predecessor subgraph G<sub>π</sub> = (V<sub>π</sub>, E<sub>π</sub>) induced by π
   V<sub>π</sub> = {v ∈ V : π[v] ≠ NIL} ∪ {s}
   E<sub>π</sub> = {(π[v], v) ∈ E : v ∈ V<sub>π</sub> {s}}

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ ののの

# Representing Shortest Paths

• Let G = (V, E) be a graph.

- $\pi[v]$  is set to a predecessor to v; that is, a vertex or NIL.
- Use procedure PRINT-PATH(G, s, v) to print the path from s to v stored in π
- Predecessor subgraph G<sub>π</sub> = (V<sub>π</sub>, E<sub>π</sub>) induced by π
   V<sub>π</sub> = {v ∈ V : π[v] ≠ NIL} ∪ {s}
   E<sub>π</sub> = {(π[v], v) ∈ E : v ∈ V<sub>π</sub> − {s}}
- After the algorithm is finished, G<sub>π</sub> is a shortest-paths tree rooted at s containing shortest paths from s to all other reachable vertices.

- ▶ By contradiction alg. returns TRUE, so  $d[v_i] \le d[v_{i-1}] + w(v_{i-1}, v_i)$  for i = 1, 2, ..., k.
- But then  $\sum_{i=1}^{k} d[v_i] \leq \sum_{i=1}^{k} d[v_{i-1}] + \sum_{i=1}^{k} w(v_{i-1}, v_i).$
- Since  $v_0 = v_k$ , we have  $\sum_{i=1}^k d[v_i] = \sum_{i=1}^k d[v_{i-1}]$ .

## Theorem 20 (Correctness II).

If G contains a negative-weight cycle reachable from s, the algorithm returns FALSE.

Proof.

- Let  $c = \langle v_0, v_1, \dots, v_k \rangle$ ,  $v_0 = v_k$ , be negative-weight cycle reachable from s.
- ▶ Then,  $\sum_{i=1}^{k} w(v_{i-1}, v_i) < 0.$
- ▶ By contradiction alg. returns TRUE, so  $d[v_i] \le d[v_{i-1}] + w(v_{i-1}, v_i)$  for i = 1, 2, ..., k.
- But then  $\sum_{i=1}^{k} d[v_i] \leq \sum_{i=1}^{k} d[v_{i-1}] + \sum_{i=1}^{k} w(v_{i-1}, v_i).$
- Since  $v_0 = v_k$ , we have  $\sum_{i=1}^k d[v_i] = \sum_{i=1}^k d[v_{i-1}]$ .
- ▶ Because for  $i = 1, 2, ..., k d[v_i] < \infty$ , we have  $0 \le \sum_{i=1}^k w(v_{i-1}, v_i)$ . Contradiction.

# Single-Source Shortest Paths in Directed Acyclic Graphs

イロト 不得 トイヨト イヨト

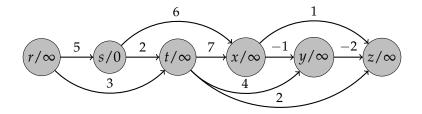

Shortest Paths in Directed Acyclic Graphs

▶ For DAG, there is significantly faster method than Bellman-Ford.

DAG-SHORTEST-PATHS(G, w, s)

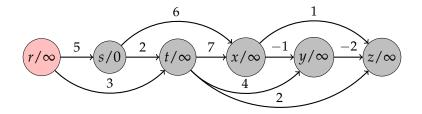

- 1 Topologically sort the vertices of G
- 2 INITIALIZE-SINGLE-SOURCE(G, s)
- 3 **for** each vertex *u*, taken in topologically sorted order
- 4 **do for** each vertex  $v \in Adj[u]$
- 5 **do**  $\operatorname{RELAX}(u, v, w)$
- Time complexity:  $\Theta(n+m)$ .
  - We get a topological order in  $\Theta(n+m)$ .
  - Line 2 takes  $\Theta(n)$ .
  - ► Lines 3-5 checks every edge exactly once; that is, the iteration is executed *m*-times. RELAX takes Θ(1).

#### Theorem 21.

If a weighted, digraph G = (V, E) has source vertex s and no cycles, then DAG-SHORTEST-PATHS computes  $d[v] = \delta(s, v)$  for all  $v \in V$ .

#### Theorem 21.

If a weighted, digraph G = (V, E) has source vertex s and no cycles, then DAG-SHORTEST-PATHS computes  $d[v] = \delta(s, v)$  for all  $v \in V$ .

Proof.

▶ If v is not reachable from s, then  $d[v] = \delta(s, v) = \infty$ .

#### Theorem 21.

If a weighted, digraph G = (V, E) has source vertex s and no cycles, then DAG-SHORTEST-PATHS computes  $d[v] = \delta(s, v)$  for all  $v \in V$ .

#### Proof.

- If v is not reachable from s, then  $d[v] = \delta(s, v) = \infty$ .
- Suppose there is a shortest path  $p = \langle v_0, v_1, \dots, v_k \rangle$ , where  $s = v_0$ and  $v = v_k$ .

#### Theorem 21.

If a weighted, digraph G = (V, E) has source vertex s and no cycles, then DAG-SHORTEST-PATHS computes  $d[v] = \delta(s, v)$  for all  $v \in V$ .

#### Proof.

- ▶ If v is not reachable from s, then  $d[v] = \delta(s, v) = \infty$ .
- Suppose there is a shortest path  $p = \langle v_0, v_1, \dots, v_k \rangle$ , where  $s = v_0$ and  $v = v_k$ .
- Because we process the vertices in topological order, we relax edges on p in the order (v<sub>0</sub>, v<sub>1</sub>), (v<sub>1</sub>, v<sub>2</sub>), ..., (v<sub>k-1</sub>, v<sub>k</sub>).

#### Theorem 21.

If a weighted, digraph G = (V, E) has source vertex s and no cycles, then DAG-SHORTEST-PATHS computes  $d[v] = \delta(s, v)$  for all  $v \in V$ .

#### Proof.

- ▶ If v is not reachable from s, then  $d[v] = \delta(s, v) = \infty$ .
- Suppose there is a shortest path p = (v<sub>0</sub>, v<sub>1</sub>, ..., v<sub>k</sub>), where s = v<sub>0</sub> and v = v<sub>k</sub>.
- Because we process the vertices in topological order, we relax edges on p in the order (v<sub>0</sub>, v<sub>1</sub>), (v<sub>1</sub>, v<sub>2</sub>), ..., (v<sub>k-1</sub>, v<sub>k</sub>).
- That implies that  $d[v_i] = \delta(s, v_i)$  at termination for i = 0, 1, ..., k.

#### Theorem 22.

Dijkstra algorithm on weighted digraph G = (V, E) without negative-weight edges and with source *s* finishes with  $d[v] = \delta(s, v)$  for all  $v \in V$ .

#### Theorem 22.

Dijkstra algorithm on weighted digraph G = (V, E) without negative-weight edges and with source *s* finishes with  $d[v] = \delta(s, v)$  for all  $v \in V$ .

Proof.

▶ Invariant: In the beginning of each while-iteration,  $d[v] = \delta(s, v)$  for all  $v \in S$ .

#### Theorem 22.

Dijkstra algorithm on weighted digraph G = (V, E) without negative-weight edges and with source *s* finishes with  $d[v] = \delta(s, v)$  for all  $v \in V$ .

Proof.

- ▶ Invariant: In the beginning of each while-iteration,  $d[v] = \delta(s, v)$  for all  $v \in S$ .
- ▶ It holds for  $S = \emptyset$ .

#### Theorem 22.

Dijkstra algorithm on weighted digraph G = (V, E) without negative-weight edges and with source *s* finishes with  $d[v] = \delta(s, v)$  for all  $v \in V$ .

Proof.

- ▶ Invariant: In the beginning of each while-iteration,  $d[v] = \delta(s, v)$  for all  $v \in S$ .
- ▶ It holds for  $S = \emptyset$ .
- Let u be first vertex such that d[u] ≠ δ(s, u) in the moment of its inclusion into S.

#### Theorem 22.

Dijkstra algorithm on weighted digraph G = (V, E) without negative-weight edges and with source *s* finishes with  $d[v] = \delta(s, v)$  for all  $v \in V$ .

#### Proof.

- ▶ Invariant: In the beginning of each while-iteration,  $d[v] = \delta(s, v)$  for all  $v \in S$ .
- ▶ It holds for  $S = \emptyset$ .
- Let u be first vertex such that d[u] ≠ δ(s, u) in the moment of its inclusion into S.
- ► Then, necessarily  $u \neq s$ , because s is included as the first into S and  $d[s] = \delta(s, s) = 0$  holds in the moment of inclusion of s into S.

#### Theorem 22.

Dijkstra algorithm on weighted digraph G = (V, E) without negative-weight edges and with source *s* finishes with  $d[v] = \delta(s, v)$  for all  $v \in V$ .

#### Proof.

- ▶ Invariant: In the beginning of each while-iteration,  $d[v] = \delta(s, v)$  for all  $v \in S$ .
- ▶ It holds for  $S = \emptyset$ .
- Let u be first vertex such that d[u] ≠ δ(s, u) in the moment of its inclusion into S.
- ► Then, necessarily  $u \neq s$ , because s is included as the first into S and  $d[s] = \delta(s,s) = 0$  holds in the moment of inclusion of s into S.
- Since  $u \neq s$ ,  $S \neq \emptyset$  right before inclusion of u.

#### Theorem 22.

Dijkstra algorithm on weighted digraph G = (V, E) without negative-weight edges and with source *s* finishes with  $d[v] = \delta(s, v)$  for all  $v \in V$ .

#### Proof.

- ► Invariant: In the beginning of each while-iteration,  $d[v] = \delta(s, v)$  for all  $v \in S$ .
- It holds for  $S = \emptyset$ .
- Let u be first vertex such that d[u] ≠ δ(s, u) in the moment of its inclusion into S.
- ► Then, necessarily  $u \neq s$ , because s is included as the first into S and  $d[s] = \delta(s,s) = 0$  holds in the moment of inclusion of s into S.
- Since  $u \neq s$ ,  $S \neq \emptyset$  right before inclusion of u.
- ► The assumption  $d[u] \neq \delta(s, u)$  implies that  $s \rightsquigarrow u$  otherwise  $d[u] = \delta(s, u) = \infty$ .

#### Theorem 22.

Dijkstra algorithm on weighted digraph G = (V, E) without negative-weight edges and with source *s* finishes with  $d[v] = \delta(s, v)$  for all  $v \in V$ .

#### Proof.

- ▶ Invariant: In the beginning of each while-iteration,  $d[v] = \delta(s, v)$  for all  $v \in S$ .
- It holds for  $S = \emptyset$ .
- Let u be first vertex such that d[u] ≠ δ(s, u) in the moment of its inclusion into S.
- ▶ Then, necessarily  $u \neq s$ , because s is included as the first into S and  $d[s] = \delta(s,s) = 0$  holds in the moment of inclusion of s into S.

132 / 252

- Since  $u \neq s$ ,  $S \neq \emptyset$  right before inclusion of u.
- ► The assumption  $d[u] \neq \delta(s, u)$  implies that  $s \rightsquigarrow u$  otherwise  $d[u] = \delta(s, u) = \infty$ .
- So there is a shortest path p from s to u.

#### Part II of the Proof.

There is a shortest path p from s to u.

- ▶ There is a shortest path *p* from *s* to *u*.
- ▶ Right before inclusion of u into S, p connects vertex  $s \in S$  with vertex  $u \in V S$ .

#### Part II of the Proof.

- There is a shortest path p from s to u.
- ▶ Right before inclusion of u into S, p connects vertex  $s \in S$  with vertex  $u \in V S$ .
- Split *p* as:

$$s \stackrel{p_1}{\leadsto} x \to y \stackrel{p_2}{\leadsto} u$$
,

where y is the first vertex on p that belongs to V - S and x is its predecessor on p.

#### Part II of the Proof.

- There is a shortest path p from s to u.
- ▶ Right before inclusion of u into S, p connects vertex  $s \in S$  with vertex  $u \in V S$ .
- Split *p* as:

$$s \stackrel{p_1}{\leadsto} x \to y \stackrel{p_2}{\leadsto} u$$
,

where y is the first vertex on p that belongs to V - S and x is its predecessor on p.

By assumption, we have d[x] = δ(s, x) in the moment of inclusion of x into S.

#### Part II of the Proof.

- There is a shortest path p from s to u.
- ► Right before inclusion of u into S, p connects vertex s ∈ S with vertex u ∈ V − S.
- Split *p* as:

$$s \stackrel{p_1}{\leadsto} x \to y \stackrel{p_2}{\leadsto} u$$
,

where y is the first vertex on p that belongs to V - S and x is its predecessor on p.

- By assumption, we have d[x] = δ(s, x) in the moment of inclusion of x into S.
- Since edge (x, y) was already relaxed in that moment, we have  $d[y] = \delta(s, y)$  in the moment of inclusion of u into S. (Prove it!)

イロト 不得下 イヨト イヨト 二日

- $s \xrightarrow{p_1} x \to y \xrightarrow{p_2} u$ , where y is the first vertex on p that belongs to V S and x is its predecessor on p.
- $d[y] = \delta(s, y)$  in the moment of inclusion of u into S.

- $s \xrightarrow{p_1} x \to y \xrightarrow{p_2} u$ , where y is the first vertex on p that belongs to V S and x is its predecessor on p.
- $d[y] = \delta(s, y)$  in the moment of inclusion of u into S.
- Since y precedes u on the shortest path from s to u and all weights are non-negative, we have  $\delta(s, y) \leq \delta(s, u)$ .

- $s \xrightarrow{p_1} x \to y \xrightarrow{p_2} u$ , where y is the first vertex on p that belongs to V S and x is its predecessor on p.
- $d[y] = \delta(s, y)$  in the moment of inclusion of u into S.
- Since y precedes u on the shortest path from s to u and all weights are non-negative, we have  $\delta(s, y) \leq \delta(s, u)$ .
- Therefore,  $d[y] = \delta(s, y) \le \delta(s, u) \le d[u]$ .

- $s \xrightarrow{p_1} x \to y \xrightarrow{p_2} u$ , where y is the first vertex on p that belongs to V S and x is its predecessor on p.
- $d[y] = \delta(s, y)$  in the moment of inclusion of u into S.
- Since y precedes u on the shortest path from s to u and all weights are non-negative, we have  $\delta(s, y) \leq \delta(s, u)$ .
- Therefore,  $d[y] = \delta(s, y) \le \delta(s, u) \le d[u]$ .
- Since both vertices y, u ∈ V − S in the moment of dequeuing of u, it holds that d[u] ≤ d[y].

- $s \xrightarrow{p_1} x \to y \xrightarrow{p_2} u$ , where y is the first vertex on p that belongs to V S and x is its predecessor on p.
- $d[y] = \delta(s, y)$  in the moment of inclusion of u into S.
- Since y precedes u on the shortest path from s to u and all weights are non-negative, we have  $\delta(s, y) \leq \delta(s, u)$ .
- Therefore,  $d[y] = \delta(s, y) \le \delta(s, u) \le d[u]$ .
- Since both vertices y, u ∈ V − S in the moment of dequeuing of u, it holds that d[u] ≤ d[y].
- ▶ In total,  $d[u] = \delta(s, u)$ . Contradiction of the assumption.

### Part III of the Proof.

- $s \xrightarrow{p_1} x \to y \xrightarrow{p_2} u$ , where y is the first vertex on p that belongs to V S and x is its predecessor on p.
- $d[y] = \delta(s, y)$  in the moment of inclusion of u into S.
- Since y precedes u on the shortest path from s to u and all weights are non-negative, we have  $\delta(s, y) \leq \delta(s, u)$ .
- Therefore,  $d[y] = \delta(s, y) \le \delta(s, u) \le d[u]$ .
- Since both vertices y, u ∈ V − S in the moment of dequeuing of u, it holds that d[u] ≤ d[y].
- ▶ In total,  $d[u] = \delta(s, u)$ . Contradiction of the assumption.
- Q = Ø when alg. finishes. Since Q = V − S (Do the reasoning!), we have S = V. So d[v] = δ(s, v) for all v ∈ V.

134 / 252

### Part III of the Proof.

- $s \xrightarrow{p_1} x \to y \xrightarrow{p_2} u$ , where y is the first vertex on p that belongs to V S and x is its predecessor on p.
- $d[y] = \delta(s, y)$  in the moment of inclusion of u into S.
- Since y precedes u on the shortest path from s to u and all weights are non-negative, we have  $\delta(s, y) \leq \delta(s, u)$ .
- Therefore,  $d[y] = \delta(s, y) \le \delta(s, u) \le d[u]$ .
- Since both vertices y, u ∈ V − S in the moment of dequeuing of u, it holds that d[u] ≤ d[y].
- ▶ In total,  $d[u] = \delta(s, u)$ . Contradiction of the assumption.
- Q = Ø when alg. finishes. Since Q = V − S (Do the reasoning!), we have S = V. So d[v] = δ(s, v) for all v ∈ V.

134 / 252

For 
$$i = j$$
 is  $m' = 0$  and  $w_{ij} = \delta(i, j) = 0$ .

For  $i \neq j$  we split path p as:

$$i \stackrel{p'}{\leadsto} k \to j$$

where p' has m' - 1 edges.

► p' is a shortest path from i to k – HOMEWORK – so  $\delta(i,j) = \delta(i,k) + w_{kj}$ .

- $\blacktriangleright$  |f| = ???

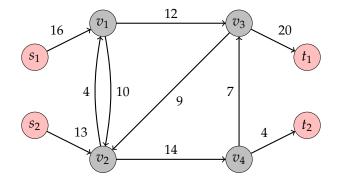

Edges labeled with f(u, v) / c(u, v). Only positive flows are shown.

- Verify that it is a flow network and some flow.
- $\blacktriangleright$  |f| = ???
- ► |f| = 19.

## Maximum-flow Problem

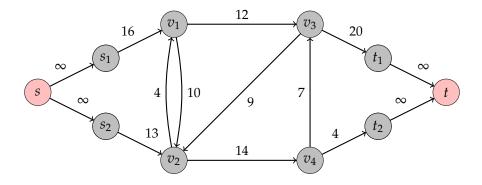

We are given a flow network G with source s and sink t,
we wish to find a flow of maximum value.

## Networks with multiple sources and sinks

How to deal with it?

## Networks with multiple sources and sinks

- How to deal with it?
- Create a new supersource s and a new supersink and set the capacity to ∞ for these new edges.

For 
$$X, Y \subseteq V$$
, we define  $f(X, Y) = \sum_{x \in X} \sum_{y \in Y} f(x, y)$ .

- ► For  $X, Y \subseteq V$ , we define  $f(X, Y) = \sum_{x \in X} \sum_{y \in Y} f(x, y)$ .
- Then, the value of f is |f| = f(s, V).

For 
$$X, Y \subseteq V$$
, we define  $f(X, Y) = \sum_{x \in X} \sum_{y \in Y} f(x, y)$ .

• Then, the value of 
$$f$$
 is  $|f| = f(s, V)$ .

For all  $X \subseteq V$ , f(X, X) = 0 — with every f(u, v) we sum in f(v, u) as well.

For 
$$X, Y \subseteq V$$
, we define  $f(X, Y) = \sum_{x \in X} \sum_{y \in Y} f(x, y)$ .

• Then, the value of 
$$f$$
 is  $|f| = f(s, V)$ .

For all  $X \subseteq V$ , f(X, X) = 0 — with every f(u, v) we sum in f(v, u) as well.

For all 
$$X, Y \subseteq V, f(X, Y) = -f(Y, X)$$
.

For 
$$X, Y \subseteq V$$
, we define  $f(X, Y) = \sum_{x \in X} \sum_{y \in Y} f(x, y)$ .

• Then, the value of 
$$f$$
 is  $|f| = f(s, V)$ .

For all  $X \subseteq V$ , f(X, X) = 0 — with every f(u, v) we sum in f(v, u) as well.

For all 
$$X, Y \subseteq V, f(X, Y) = -f(Y, X)$$
.

For all 
$$X, Y, Z \subseteq V, X \cap Y = \emptyset$$
,

$$f(X \cup Y, Z) = f(X, Z) + f(Y, Z)$$

and

$$f(Z, X \cup Y) = f(Z, X) + f(Z, Y).$$

Prove that |f| = f(V, t).

Prove that 
$$|f| = f(V, t)$$
.

Proof.

$$\blacktriangleright |f| = f(s, V)$$

Prove that |f| = f(V, t).

Proof.

$$\blacktriangleright |f| = f(s, V)$$

▶ We know that f(V, V) = f(s, V) + f(V - s, V) – see above.

Prove that |f| = f(V, t).

Proof.

$$\blacktriangleright |f| = f(s, V)$$

- ▶ We know that f(V, V) = f(s, V) + f(V s, V) see above.
- Therefore, f(s, V) = f(V, V) f(V s, V).

Prove that |f| = f(V, t).

Proof.

- $\blacktriangleright |f| = f(s, V)$
- ▶ We know that f(V, V) = f(s, V) + f(V s, V) see above.
- Therefore, f(s, V) = f(V, V) f(V s, V).
- We know that f(V, V) = 0 see above.

Prove that |f| = f(V, t).

Proof.

- $\blacktriangleright |f| = f(s, V)$
- ▶ We know that f(V, V) = f(s, V) + f(V s, V) see above.

168 / 252

- Therefore, f(s, V) = f(V, V) f(V s, V).
- We know that f(V, V) = 0 see above.
- ► Therefore, f(s, V) = -f(V s, V) = f(V, V s).

Prove that |f| = f(V, t).

Proof.

- $\blacktriangleright |f| = f(s, V)$
- ▶ We know that f(V, V) = f(s, V) + f(V s, V) see above.
- Therefore, f(s, V) = f(V, V) f(V s, V).
- We know that f(V, V) = 0 see above.
- ► Therefore, f(s, V) = -f(V s, V) = f(V, V s).
- ▶ We know that f(V, V s) = f(V, t) + f(V, V s t) see above.

Prove that |f| = f(V, t).

Proof.

- $\blacktriangleright |f| = f(s, V)$
- We know that f(V, V) = f(s, V) + f(V s, V) see above.
- Therefore, f(s, V) = f(V, V) f(V s, V).
- ▶ We know that f(V, V) = 0 see above.
- ► Therefore, f(s, V) = -f(V s, V) = f(V, V s).
- ▶ We know that f(V, V s) = f(V, t) + f(V, V s t) see above.
- From the previous and by flow conservation,  $f(V, V s t) = -f(V s t, V) = -\sum_{u \in V \{s,t\}} \sum_{v \in V} f(u, v) = -\sum_{u \in V \{s,t\}} 0 = 0.$

168 / 252

(1)

Prove that |f| = f(V, t).

Proof.

- $\blacktriangleright |f| = f(s, V)$
- We know that f(V, V) = f(s, V) + f(V s, V) see above.
- Therefore, f(s, V) = f(V, V) f(V s, V).
- We know that f(V, V) = 0 see above.
- ► Therefore, f(s, V) = -f(V s, V) = f(V, V s).
- ▶ We know that f(V, V s) = f(V, t) + f(V, V s t) see above.
- From the previous and by flow conservation,  $f(V, V s t) = -f(V s t, V) = -\sum_{u \in V \{s,t\}} \sum_{v \in V} f(u, v) = -\sum_{u \in V \{s,t\}} 0 = 0.$

• Thus, |f| = f(V, t).

#### Lemma 23.

Let G = (V, E) be a network and f be a flow in G. Let  $G_f$  be a residual network of G induced by f and let f' be a flow in  $G_f$ . Then, f + f' is a flow in G with the value of |f + f'| = |f| + |f'|.

Proof.

We must verify that tree conditions from the definition of a flow.

Demonstrate that  $(f + f')(u, v) \leq c(u, v)$ .

► 
$$f'(u,v) \leq c_f(u,v)$$
.

Demonstrate that  $(f + f')(u, v) \leq c(u, v)$ .

Demonstrate that  $(f + f')(u, v) \le c(u, v)$ .

Demonstrate that  $(f + f')(u, v) \le c(u, v)$ .

Proof.

▲□▶ ▲圖▶ ▲ 圖▶ ▲ 圖▶ ― 圖 … のへで

Demonstrate that (f + f')(u, v) = -(f + f')(v, u). Proof.

• 
$$(f+f')(u,v) = f(u,v) + f'(u,v)$$

Demonstrate that (f + f')(u, v) = -(f + f')(v, u). Proof.

• 
$$(f+f')(u,v) = f(u,v) + f'(u,v)$$
  
=  $-f(v,u) - f'(v,u)$ 

Demonstrate that (f + f')(u, v) = -(f + f')(v, u). Proof.

# Cut in Network

・ロト・4回ト・4回ト・4回ト・4回ト

182 / 252

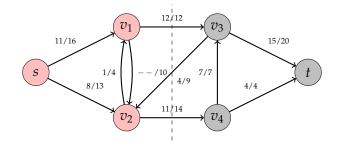

Network cut in G = (V, E) is a partition of V to S and T = V − S such that s ∈ S and t ∈ T.

- Network cut in G = (V, E) is a partition of V to S and T = V − S such that s ∈ S and t ∈ T.
- Flow through a cut is defined as f(S,T).

- Network cut in G = (V, E) is a partition of V to S and T = V − S such that s ∈ S and t ∈ T.
- Flow through a cut is defined as f(S,T).
- Cut capacity (S,T) is c(S,T).

- Network cut in G = (V, E) is a partition of V to S and T = V − S such that s ∈ S and t ∈ T.
- Flow through a cut is defined as f(S,T).
- Cut capacity (S,T) is c(S,T).
- Minimal cut is a cut with minimal capacity.

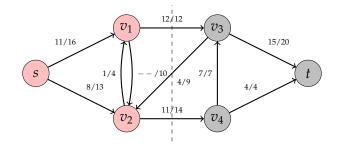

#### Cut in Network – Example

Flow through a cut:  $f({s, v_1, v_2}, {v_3, v_4, t}) = f(v_1, v_3) + f(v_2, v_3) + f(v_2, v_4) = 12 + (-4) + 11 = 19.$ 

イロト イポト イヨト イヨト

#### Cut in Network - Example

- Flow through a cut:  $f({s, v_1, v_2}, {v_3, v_4, t}) = f(v_1, v_3) + f(v_2, v_3) + f(v_2, v_4) = 12 + (-4) + 11 = 19.$
- Cut capacity:  $c(\{s, v_1, v_2\}, \{v_3, v_4, t\}) = c(v_1, v_3) + c(v_2, v_4) = 12 + 14 = 26.$

イロト イボト イヨト

#### Lemma 26.

Let f be a flow in G with source s and sink t and let (S,T) be a cut of G. Then, |f| = f(S,T).

$$\blacktriangleright f(S,T) = f(S,V) - f(S,S)$$

#### Lemma 26.

Let f be a flow in G with source s and sink t and let (S,T) be a cut of G. Then, |f| = f(S,T).

► 
$$f(S,T) = f(S,V) - f(S,S)$$
  
=  $f(S,V)$ 

#### Lemma 26.

Let f be a flow in G with source s and sink t and let (S,T) be a cut of G. Then, |f| = f(S,T).

Proof.

► 
$$f(S,T) = f(S,V) - f(S,S)$$
  
=  $f(S,V)$   
=  $f(s,V) + f(S - \{s\},V)$

=  $f(s,V)$   
=  $|f|$ 

#### Corollary 27.

The value of any flow f in G is bounded from above by the capacity of any cut of G.

Proof.

 $\blacktriangleright$  |f| = f(S,T)

#### Corollary 27.

The value of any flow f in G is bounded from above by the capacity of any cut of G.

$$|f| = f(S,T)$$
$$= \sum_{u \in S} \sum_{v \in T} f(u,v)$$

#### Corollary 27.

The value of any flow f in G is bounded from above by the capacity of any cut of G.

$$|f| = f(S,T) = \sum_{u \in S} \sum_{v \in T} f(u,v) \leq \sum_{u \in S} \sum_{v \in T} c(u,v)$$

#### Corollary 27.

The value of any flow f in G is bounded from above by the capacity of any cut of G.

$$|f| = f(S,T) = \sum_{u \in S} \sum_{v \in T} f(u,v) \leq \sum_{u \in S} \sum_{v \in T} c(u,v) = c(S,T)$$

#### Corollary 27.

The value of any flow f in G is bounded from above by the capacity of any cut of G.

Proof.

$$|f| = f(S,T)$$
  
=  $\sum_{u \in S} \sum_{v \in T} f(u,v)$   
 $\leq \sum_{u \in S} \sum_{v \in T} c(u,v)$   
=  $c(S,T)$ 

The value of a maximum flow is equal or less than the capacity of a minimum cut.

Let f be a flow in G with source s and sink t. Then, the following conditions are equivalent:

- 1. f is a maximum flow in G.
- 2. The residual network  $G_f$  contains no augmenting path.

3. 
$$|f| = c(S,T)$$
 for some cut  $(S,T)$  of G.

Proof.

►  $(1) \Rightarrow (2)$ :

Let f be a flow in G with source s and sink t. Then, the following conditions are equivalent:

- 1. f is a maximum flow in G.
- 2. The residual network  $G_f$  contains no augmenting path.

3. 
$$|f| = c(S,T)$$
 for some cut  $(S,T)$  of G.

Proof.

► (1)  $\Rightarrow$  (2):

• Let f is maximum flow and p is an augmenting path in  $G_f$ .

Let f be a flow in G with source s and sink t. Then, the following conditions are equivalent:

- 1. f is a maximum flow in G.
- 2. The residual network  $G_f$  contains no augmenting path.

3. 
$$|f| = c(S,T)$$
 for some cut  $(S,T)$  of G.

Proof.

- ►  $(1) \Rightarrow (2)$ :
  - Let f is maximum flow and p is an augmenting path in  $G_f$ .
  - ▶ Then,  $f + f_p$  is a flow in G and  $|f + f_p| > |f|$ . Contradition.

Let f be a flow in G with source s and sink t. Then, the following conditions are equivalent:

188 / 252

- 1. f is a maximum flow in G.
- 2. The residual network  $G_f$  contains no augmenting path.
- 3. |f| = c(S,T) for some cut (S,T) of G.

Proof.

► (2)  $\Rightarrow$  (3):

Let f be a flow in G with source s and sink t. Then, the following conditions are equivalent:

- 1. f is a maximum flow in G.
- 2. The residual network  $G_f$  contains no augmenting path.
- 3. |f| = c(S,T) for some cut (S,T) of G.

Proof.

► (2)  $\Rightarrow$  (3):

Let  $G_f$  contains no augmenting path, so no path from s to t in  $G_f$ .

Let f be a flow in G with source s and sink t. Then, the following conditions are equivalent:

- 1. f is a maximum flow in G.
- 2. The residual network  $G_f$  contains no augmenting path.
- 3. |f| = c(S,T) for some cut (S,T) of G.

Proof.

(2) ⇒ (3):
 Let G<sub>f</sub> contains no augmenting path, so no path from s to t in G<sub>f</sub>.
 Let

 $S = \{v \in V : \text{there exists a path from } s \text{ to } v \text{ in } G_f\}$ 

Let f be a flow in G with source s and sink t. Then, the following conditions are equivalent:

- 1. f is a maximum flow in G.
- 2. The residual network  $G_f$  contains no augmenting path.
- 3. |f| = c(S,T) for some cut (S,T) of G.

Proof.

(2) ⇒ (3):
 Let G<sub>f</sub> contains no augmenting path, so no path from s to t in G<sub>f</sub>.
 Let

 $S = \{v \in V : \text{there exists a path from } s \text{ to } v \text{ in } G_f\}$ 

188 / 252

▶ and let T = V - S.

Let f be a flow in G with source s and sink t. Then, the following conditions are equivalent:

- 1. f is a maximum flow in G.
- 2. The residual network  $G_f$  contains no augmenting path.
- 3. |f| = c(S,T) for some cut (S,T) of G.

Proof.

## Edge Graph Coloring

- Basic observation:
- $\blacktriangleright \Delta \leq \psi_e(G).$

# **Theorem 28.** If G is bipartite, then $\psi_e(G) = \Delta$ .

Proof

By induction on the cardinality of set of edges.

#### Theorem 28.

If G is bipartite, then  $\psi_e(G) = \Delta$ .

- By induction on the cardinality of set of edges.
- $\blacktriangleright$  |E| = 1 obvious.

#### Theorem 28.

If G is bipartite, then  $\psi_e(G) = \Delta$ .

- By induction on the cardinality of set of edges.
- $\blacktriangleright$  |E| = 1 obvious.
- Assume that all edges but one are coloured using at most  $\Delta$  colors.

#### Theorem 28.

If G is bipartite, then  $\psi_e(G) = \Delta$ .

- By induction on the cardinality of set of edges.
- $\blacktriangleright$  |E| = 1 obvious.
- Assume that all edges but one are coloured using at most  $\Delta$  colors.
- ▶ The uncolored edge is (u, v).

#### Theorem 28.

If G is bipartite, then  $\psi_e(G) = \Delta$ .

- By induction on the cardinality of set of edges.
- ► |E| = 1 obvious.
- Assume that all edges but one are coloured using at most  $\Delta$  colors.
- The uncolored edge is (u, v).
- Since we can use ∆ colors, at least one color is not incident to u and one is no incident to v.

#### Theorem 28.

If G is bipartite, then  $\psi_e(G) = \Delta$ .

#### Proof

- By induction on the cardinality of set of edges.
- $\blacktriangleright$  |E| = 1 obvious.
- Assume that all edges but one are coloured using at most  $\Delta$  colors.
- The uncolored edge is (u, v).
- Since we can use ∆ colors, at least one color is not incident to u and one is no incident to v.
- If they are the same, we are done.

イロト イヨト イヨト イヨト ヨー のくの

#### Theorem 28.

If G is bipartite, then  $\psi_e(G) = \Delta$ .

#### Proof

- By induction on the cardinality of set of edges.
- ► |E| = 1 obvious.
- Assume that all edges but one are coloured using at most  $\Delta$  colors.
- The uncolored edge is (u, v).
- Since we can use ∆ colors, at least one color is not incident to u and one is no incident to v.
- If they are the same, we are done.
- If they differ, we label these colors by  $C_1$  and  $C_2$ .

The colors not incident to u and v are denoted by C<sub>1</sub> and C<sub>2</sub>, respectively.

- The colors not incident to u and v are denoted by C<sub>1</sub> and C<sub>2</sub>, respectively.
- Let H<sub>u</sub>(C<sub>1</sub>, C<sub>2</sub>) be a subgraph containing u and all edges reachable from u that are coloured only by C<sub>1</sub> and C<sub>2</sub>.

- The colors not incident to u and v are denoted by C<sub>1</sub> and C<sub>2</sub>, respectively.
- Let H<sub>u</sub>(C<sub>1</sub>, C<sub>2</sub>) be a subgraph containing u and all edges reachable from u that are coloured only by C<sub>1</sub> and C<sub>2</sub>.
- Since (u, v) is an edge, u and v belongs to the different partite sets.

▲□▶ ▲□▶ ▲三▶ ▲三▶ - 三 - のへで

- The colors not incident to u and v are denoted by C<sub>1</sub> and C<sub>2</sub>, respectively.
- Let H<sub>u</sub>(C<sub>1</sub>, C<sub>2</sub>) be a subgraph containing u and all edges reachable from u that are coloured only by C<sub>1</sub> and C<sub>2</sub>.
- Since (u, v) is an edge, u and v belongs to the different partite sets.
- ► Then, every path from u to v in H<sub>u</sub>(C<sub>1</sub>, C<sub>2</sub>) must have the last edge coloured by C<sub>2</sub>.

- The colors not incident to u and v are denoted by C<sub>1</sub> and C<sub>2</sub>, respectively.

- ▶ No  $\Delta$ -coloring for a complete graph with odd n ( $\Delta = n 1$ ).
- ▶ Assume it is possible. Then, if G has  $\frac{1}{2}n(n-1)$  edges, we have at least  $\frac{1}{2}n$  edges of the same color.
- Let M ⊆ E such that no two edges from M are incident to the same vertex.
- Therefore,  $|M| \leq \frac{1}{2}(n-1)$  (prove as a homework).

- Case 2: Let *n* be even.
- ▶ Describe G as the complete graph G' with n − 1 vertices + one more vertex connected to all others.

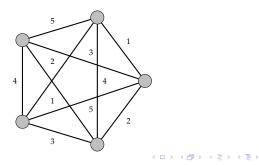

- Case 2: Let *n* be even.
- ▶ Describe G as the complete graph G' with n − 1 vertices + one more vertex connected to all others.
- Use the procedure from Case 1 on G'.

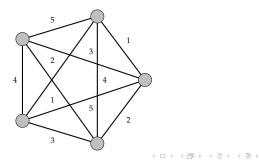

- Case 2: Let *n* be even.
- ▶ Describe G as the complete graph G' with n − 1 vertices + one more vertex connected to all others.
- Use the procedure from Case 1 on G'.
- There is one unused color in each vertex.

- Case 2: Let *n* be even.
- ▶ Describe G as the complete graph G' with n − 1 vertices + one more vertex connected to all others.
- Use the procedure from Case 1 on G'.
- There is one unused color in each vertex.
- ► All these colors are mutually different, so we can use them to paint the edges of "G - G'".

- Case 2: Let *n* be even.
- ▶ Describe G as the complete graph G' with n − 1 vertices + one more vertex connected to all others.
- ▶ Use the procedure from Case 1 on G'.
- There is one unused color in each vertex.
- ► All these colors are mutually different, so we can use them to paint the edges of "G - G'".
- ▶ In the end, we used at most  $\Delta = n 1$  colors.

#### Theorem 30.

Let G be an undirected graph. Then,  $\Delta \leq \psi_e(G) \leq \Delta + 1$ .

Proof

• We must show that  $\psi_e(G) \leq \Delta + 1$ .

#### Theorem 30.

Let G be an undirected graph. Then,  $\Delta \leq \psi_e(G) \leq \Delta + 1$ .

Proof

- We must show that  $\psi_e(G) \leq \Delta + 1$ .
- ▶ By induction on the number of edges.

Theorem 31.

Any (simple) graph G has  $\Delta + 1$ -coloring.

Proof.

- By induction on *n*.
- ▶ n = 1, obvious.
- If we add vertex u, then it is connected with at most  $\Delta$  other vertices.
- Since we have  $\Delta + 1$  colors, we have one spare color to paint u.

#### ► In most cases: $\psi_v(G) < \Delta + 1$ .

- ► In most cases:  $\psi_v(G) < \Delta + 1$ .
- Example:

- ► In most cases:  $\psi_v(G) < \Delta + 1$ .
- ► Example:
- If G is planar, then  $\psi_v(G) \leq 4$ , but  $\Delta$  can be arbitrary.

- ► In most cases:  $\psi_v(G) < \Delta + 1$ .
- Example:
- If G is planar, then  $\psi_v(G) \leq 4$ , but  $\Delta$  can be arbitrary.
- Homework: Design your own algorithm to find some proper coloring of a given graph?

### Exercises

- 1. Consider  $3 \times 3$  chessboard represented as a graph with 9 vertices where an undirected edge (u, v) represents that a chess piece placed at u dominates v (it can attack the other piece at v) and vice versa. Use graph coloring to determine how many queens we can place on this chessboard so they do not attack each other.
- 2. Derive chromatic polynomial using subtracting formula for the complete graph with 4 vertices.
- 3. Derive chromatic polynomial using adding formula for the isolated graph with 4 vertices.
- 4. Use approximate vertex coloring algorithm for a bipartite graph with  $L = \{u_1, u_2, \ldots, u_k\}, R = \{v_1, v_2, \ldots, v_k\}$ , and  $E = \{(u_i, v_j) : i \neq j\}, k \geq 2$ . First, consider the vertices are colored in the order  $u_1, u_2, \ldots, u_k, v_1, v_2, \ldots, v_k$ . Second, apply the algorithm in the other order  $u_1, v_1, u_2, v_2, \ldots, u_k, v_k$ . Compare the results.

Definition note: Tour = path or circuit; Cycle/Circuit = closed path

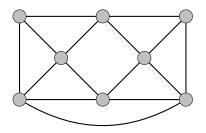

# Eulerian graph

Eulerian graph is a graph that contains an Eulerian circuit; that is, a closed path that visits all edges exactly once.

# Eulerian graph

- Eulerian graph is a graph that contains an Eulerian circuit; that is, a closed path that visits all edges exactly once.
- Note that Eulerian path does not have to be closed, but then the graph is not Eulerian.

イロト 不得 トイヨト イヨト

### Theorem 33.

An undirected graph G, has an Eulerian tour if and only if it is connected and the number of odd-degree vertices is 0 or 2.

#### Proof

Necessary condition: If an Eulerian path exists in G then G must be connected and only vertices on the ends of the path can be of odd-degree.

#### Theorem 36.

If G is connected and balanced digraph with a directed spanning tree T rooted at u, then we can find Eulerian circuit in the reverse order in the following way:

- (a) Start with any edge incident to u.
- (b) Next edges are chosen as incident to the current vertex such that:
  - (i) the edge was not visited yet,
  - (ii) the edges from T are chosen as the last ones.
- (c) The search ends if the current vertex has no incident unvisited edges.

### Proof

▶ The balanced property guarantees that it ends back in root *u*.

### Theorem 36.

- Second part proves that this is the best sufficient condition based on the degrees of vertices.
- ▶ The proof by contradiction is very complex and non-constructive.

Biconnected graph is a graph where any one vertex can be removed and graph remains connected. That is, there is no articulation vertex.

Biconnected graph is a graph where any one vertex can be removed and graph remains connected. That is, there is no articulation vertex.

#### Theorem 42.

All Hamiltonian graphs are biconnected.

Biconnected graph is a graph where any one vertex can be removed and graph remains connected. That is, there is no articulation vertex.

Theorem 42.

All Hamiltonian graphs are biconnected.

But a biconnected graph need not be Hamiltonian.

Biconnected graph is a graph where any one vertex can be removed and graph remains connected. That is, there is no articulation vertex.

### Theorem 42.

All Hamiltonian graphs are biconnected.

- But a biconnected graph need not be Hamiltonian.
- See, for example, the Petersen graph

Salesman want to visit n cities without repetition and with the shortest circuit return to the starting city.

- Salesman want to visit n cities without repetition and with the shortest circuit return to the starting city.
- Corresponds to Hamiltonian graphs: Find the shortest Hamiltonian circuit in weighted complete graph.

- Salesman want to visit n cities without repetition and with the shortest circuit return to the starting city.
- Corresponds to Hamiltonian graphs: Find the shortest Hamiltonian circuit in weighted complete graph.
- Technique: Optimization task  $\rightarrow$  problem over complete graph:

- Salesman want to visit n cities without repetition and with the shortest circuit return to the starting city.
- Corresponds to Hamiltonian graphs: Find the shortest Hamiltonian circuit in weighted complete graph.
- Technique: Optimization task  $\rightarrow$  problem over complete graph:
  - Add edges to the general graph G to get complete graph K, weight the edges by M.

- Salesman want to visit n cities without repetition and with the shortest circuit return to the starting city.
- Corresponds to Hamiltonian graphs: Find the shortest Hamiltonian circuit in weighted complete graph.
- Technique: Optimization task  $\rightarrow$  problem over complete graph:
  - Add edges to the general graph G to get complete graph K, weight the edges by M.
  - ▶ *M* is big enough (e.g. the sum of all original weights).

- Salesman want to visit n cities without repetition and with the shortest circuit return to the starting city.
- Corresponds to Hamiltonian graphs: Find the shortest Hamiltonian circuit in weighted complete graph.
- Technique: Optimization task  $\rightarrow$  problem over complete graph:
  - Add edges to the general graph G to get complete graph K, weight the edges by M.
  - ▶ *M* is big enough (e.g. the sum of all original weights).
  - Solve the problem in K. If the result contains edge with M, there is no solution in G.
